The Theory of Search Games and Rendezvous Steve Alpern,Shmuel Gal,2006-04-10 Search Theory is one of the original disciplines within the field of Operations Research It deals with the problem faced by a Searcher who wishes to minimize the time required to find a hidden object or target The Searcher chooses a path in the search space and finds the target when he is sufficiently close to it Traditionally the target is assumed to have no motives of its own regarding when it is found it is simply stationary and hidden according to a known distribution e g oil or its motion is determined stochastically by known rules e g a fox in a forest The problems dealt with in this book assume on the contrary that the target is an

independent player of equal status to the Searcher who cares about when he is found We consider two possible motives of the target and divide the book accordingly Book I considers the zero sum game that results when the target here called the Hider does not want to be found Such problems have been called Search Games with the zero sum qualifier understood Book II considers the opposite motive of the target namely that he wants to be found In this case the Searcher and the Hider can be thought of as a team of agents simply called Player I and Player II with identical aims and the coordination problem they jointly face is called the Rendezvous Search Problem

Dispersal, Individual Movement and Spatial Ecology Mark A. Lewis, Philip K. Maini, Sergei V. Petrovskii, 2013-03-21 Dispersal of plants and animals is one of the most fascinating subjects in ecology It has long been

recognized as an important factor affecting ecosystem dynamics Dispersal is apparently a phenomenon of biological origin however because of its complexity it cannot be studied comprehensively by biological methods alone Deeper insights into dispersal properties and implications require interdisciplinary approaches involving biologists ecologists and mathematicians The purpose of this book is to provide a forum for researches with different backgrounds and expertise and to ensure further advances in the study of dispersal and spatial ecology This book is unique in its attempt to give an overview of dispersal studies across different spatial scales such as the scale of individual movement the population scale and the scale of communities and ecosystems It is written by top level experts in the field of dispersal modeling and covers a wide range of problems ranging from the identification of Levy walks in animal movement to the implications of dispersal on an evolutionary timescale
