*The Psychology of Childhood Illness* Christine Eiser, 2012-12-06 The pattern of childhood illness has changed significantly during this century Many frightening conditions such as polio and tuberculosis have essentially been eradicated Other conditions that were once fatal have now achieved the status of chronic disorders for example leukemia cancer and cystic fibrosis Technological advances which have resulted in the medical treatment of these conditions have however created a gamut of psychological problems for the children and their families Recognition of these problems has lagged behind other advances in pediatric medicine The emergence of a specialist area of pediatric psychology Wright 1975 has largely been responsible for the mushrooming of research in the area In much early work the emphasis was on the impact of chronic illness on children and their families Reactions at times of greatest trauma especially diagnosis or death were particularly well documented Issues relating to day to day aspects of child care involving questions of discipline or protectiveness have received much less attention As far as the sick child is concerned there has been much investigation of academic and intellectual development as well as of personality changes that might accompany illness Psychosocial Family
