The Piezjunction Effect in Silicon Integrated Circuits and Sensors Fabiano Fruett, Gerard C.M. Meijer, 2006-04-18. Mechanical stress affects the magnitude of base emitter voltages of forward biased bipolar transistors. This phenomenon is called the piezjunction effect. The piezjunction effect is the main cause of inaccuracy and drift in integrated temperature sensors and bandgap voltage references. The aim of The Piezjunction Effect in Silicon Integrated Circuits and Sensors is twofold: Firstly to describe techniques that can reduce the mechanical stress induced inaccuracy and long term instability; Secondly to show that the piezjunction effect can be applied for new types of mechanical sensor structures. During IC fabrication and packaging, thermo mechanical stress is induced when the packaged chips cool down to the temperature of application. The piezjunction effect is caused by a stress induced change in the conductivity of the minority charge carriers while the piezoresistive effect is caused by a similar effect for the majority charge carriers. To characterise the anisotropic piezjunction effect, the authors performed systematic investigations over wide ranges of mechanical stress and temperature. The experiments have been performed for various crystal and stress orientations. The experimental results have been used to extract the first and second order piezjunction FOPJ and SOPJ coefficients for bipolar transistors. It is shown how the knowledge of the piezjunction and piezoresistive coefficients can be used to minimize the undesirable mechanical stress effects on the electrical characteristics of transistors and resistors.

respectively. Devices with lower mechanical stress sensitivity can be found by comparing their piezo coefficients. The layout of the device can also be optimized to reduce the mechanical stress sensitivity. As a next step, it is shown how the knowledge of the piezo effects on device level can be used to predict and to reduce their negative influence on circuit level. This is demonstrated for a number of important basic circuits including translinear circuits, temperature transducers, and bandgap references. Finally, it is shown how the piezjunction effect can be used to fabricate stress sensing elements. It appears that in comparison with resistive stress sensing elements, the piezjunction sensors have the advantage of a smaller size and very low power dissipation.
