Abstract

We describe qualitative and quantitative development and preliminary validation of the Patient Assessment for Low Back Pain–Impacts (PAL-I), a patient-reported outcome measure for use in chronic low back pain (cLBP) clinical trials. Concept elicitation and cognitive interviews (qualitative methods) were used to identify and refine symptom concepts. Classical test theory and Rasch measurement theory (quantitative methods) were used to evaluate item-level and scale-level performance of the PAL-I using an iterative approach between qualitative and quantitative methods. Patients with cLBP participated in concept elicitation interviews (N = 43), cognitive interviews (N = 38), and assessment of paper-to-electronic format equivalence (N = 8). A web-based sample of self-reported patients with cLBP participated in quantitative studies to evaluate preliminary (N = 598) and revised (n = 401) drafts and patients with physician-diagnosed cLBP (N = 45) participated in preliminary validation of the PAL-I. The instrument contained 9 items describing cLBP impacts (walking, sitting, standing, lifting, sleep, social activities, travelling, climbing, and body movements). Item-level performance, scale structure, and scoring seemed to be appropriate. One-week test-retest reproducibility was acceptable (intraclass correlation coefficient 0.88 [95% confidence interval, 0.78–0.94]). Convergent validity was demonstrated with PAL-I total score and Roland-Morris Disability Questionnaire (Pearson correlation 0.82), MOS-36 Physical Functioning (−0.71), and MOS-36 Bodily Pain (−0.71). Individual item scores and total score discriminated between numeric rating scale tertile groups and painDETECT categories. Interpretation of paper and electronic administration modes was equivalent. The PAL-I demonstrated content validity and is potentially useful to assess treatment benefit in clinical trials of cLBP therapies.

1. Introduction

Low back pain (LBP) is described as “pain, muscle tension, or stiffness localized below the costal margin and above the gluteal folds, with or without leg pain.”^{a1,b,20} Low back pain is a common

and painful condition that has been reported to have a global prevalence up to 84% depending on the case definition.² The prevalence of chronic LBP (cLBP), defined as LBP with duration >12 weeks,²¹ is estimated to be ~23%.² Low back pain causes more global disability than any other condition¹⁰ and is frequently work-related. Treatments for cLBP include nonsteroidal anti-inflammatory drugs, acetaminophen, muscle relaxants, opioid pain medications, and physical therapy, which are effective for most patients.¹¹ For moderate-to-severe pain, epidural steroid injections, facet injections, and radiofrequency ablations are used.¹¹ Several promising new therapies are in phase 2/3 clinical trials for the treatment of cLBP, including ethanol gel for use in chemonucleolysis protocols (a process of injecting proteolytic enzymes into the intervertebral disk), platelet-rich plasma, stem-cell therapy for disk regeneration, tanezumab (an anti-nerve growth factor antibody) for nociceptor modulation, artemin (a neurotrophic growth factor) for neuronal regrowth,¹¹ and celeranopadol, a nociceptin/orphanin FQ peptide and opioid peptide receptor agonist.⁶

Patient-reported outcome (PRO) measures are used to evaluate patient perspective in clinical trials. Patient-reported outcome measures capture the health experience of patients and can be used to document treatment benefit and support labeling claims.^{17,19} Many PRO measures/instruments are currently used in clinical trials of cLBP, including the Neuropathic Pain Symptom Inventory (NPSI), painDETECT, Roland-Morris Disability Questionnaire (RMDQ), Pain
