

# Humpback Whales

The humpback whale is a large, endangered mammal with a unique hump positioned in front of its small dorsal fin. They are often found in large groups, called pods, and are well-known for their singing abilities and being the noisiest of whales.

## What do they look like?

<b>Colour:</b>	usually dark grey.
<b>Length:</b>	grow to around 14 to 19 metres long.
<b>Weight:</b>	around 36,000kg.
<b>Features:</b>	white belly, long flippers and a tail fin called the fluke.

The whales use their flippers and their fluke to slap the surface of the water and to push themselves through it. They also use them when they want to leap out of the water. Scientists are still unsure if the whales do this for enjoyment or if it is actually helping the whale to do a job.

## Where do they live?

Humpback whales are typically found near the coastline and travel thousands of miles when they migrate. In the summer months, they can be found near to the Arctic and Antarctic where there is plenty of food for them to eat. In the winter months, they move to warmer climates found nearer to the equator. This is where they go to find a mate and breed.

## What do they eat?

Humpback whales are baleen whales. Baleen whales have baleen plates instead of teeth. This means they hunt and eat their food differently to other whales which have teeth. They eat their food by filtering it. These large predators open their mouths as they head towards their prey and filter enormous amounts of krill, shrimp, anchovies, small fish and numerous crustaceans from the sea. They then push the water out of their mouths leaving just their food behind.

Humpback whales have also been seen trapping their prey inside a 'bubble net'. The whale dives into the ocean and then swims back up in a spiralling motion while it slowly releases bubbles from its blow hole. These bubbles form a sort of net around the prey causing them to be stuck within the bubbles. The whale then swims up through the net and feeds on what has been caught.
