Results

to estimate the electrical generation, or the thermal loss, we measured two laser Doppler anemometers, where the first laser Doppler anemometer (Doppler velocimetry) was used to measure the velocity of the flow in the channel, and the second laser Doppler anemometer (Doppler velocimetry) was used to measure the velocity of the flow in the channel. The results of the measurements are presented in Table 1. The results of the measurements are presented in Table 1. The results of the measurements are presented in Table 1.

Quantum Transport in Ultrasmall Devices David K. Ferry, Harold L. Grubin, Carlo Jacoboni, A.-P. Jauho, 2012-12-06 The operation of semiconductor devices depends upon the use of electrical potential barriers such as gate depletion in controlling the carrier densities electrons and holes and their transport Although a successful device design is quite complicated and involves many aspects the device engineering is mostly to devise a best device design by defining optimal device structures and manipulating impurity profiles to obtain optimal control of the carrier flow through the device This becomes increasingly difficult as the device scale becomes smaller and smaller Since the introduction of integrated circuits the number of individual transistors on a single chip has doubled approximately every three years As the number of devices has grown the critical dimension of the smallest feature such as a gate length which is related to the transport length defining the channel has consequently declined The reduction of this design rule proceeds approximately by a factor of 1.4 each generation which means we will be using 0.1015 μm rules for the 4 Gb chips a decade from now If we continue this extrapolation current technology will require 30 nm design rules and a cell 3.2 size **IEICE Transactions on Electronics** ,2005
