Séminaire de théorie des nombres, Paris 1984-85, 1986 Séminaire de Théorie des Nombres, Paris 1985-86 C.

Goldstein, 2013-12-01 This is the sixth annual volume of papers based on the outstanding lectures given at the Séminaire de Théorie des Nombres de Paris. The results presented in 1985-86 by an international group of mathematicians reflect the most recent work in many areas of number theory. Lectures on the Geometry of Poisson Manifolds Izu Vaisman, 1994-03-01

Everybody having even the slightest interest in analytical mechanics remembers having met there the Poisson bracket of two functions of $2n$ variables p_i, q_i and the fundamental role it plays in that field. In modern works this bracket is derived from a symplectic structure and it appears as one of the main ingredients of symplectic manifolds. In fact it can even be taken as the defining element of the structure. But the study of some mechanical systems particularly systems with symmetry groups or constraints may lead to more general Poisson brackets. Therefore it was natural to define a mathematical structure where the notion of a Poisson bracket would be the primary notion of the theory and from this viewpoint such a theory has been developed since the early 1970s by A. Lichnerowicz, A. Weinstein and many other authors see the references at the end of the book. But it has been remarked by Weinstein [We3] that in fact the theory can be traced back to S. Lie himself. Most of the leading international specialists were present and the lectures reflected the great advances that have taken place in this area. The papers cover all the main branches of the subject and include not only definitive research but valuable survey articles. *Some Problems of Unlikely Intersections in Arithmetic and Geometry*

Umberto Zannier, 2012-03-25 This book considers the so called Unlikely Intersections a topic that embraces well known issues such as Lang's and Manin-Mumford's concerning torsion points in subvarieties of tori or abelian varieties. More generally the book considers algebraic subgroups that meet a given subvariety in a set of unlikely dimension. The book is an expansion of the Hermann Weyl Lectures delivered by Umberto Zannier at the Institute for Advanced Study in Princeton in May 2010. The book consists of four chapters and seven brief appendixes the last six by David Masser. The first chapter considers multiplicative algebraic groups presenting proofs of several developments ranging from the origins to recent results and discussing many applications and relations with other contexts. The second chapter considers an analogue in arithmetic and several applications of this. The third chapter introduces a new method for approaching some of these

questions and presents a detailed application of this by Masser and the author to a relative case of the Manin Mumford issue
 The fourth chapter focuses on the Andr Oort conjecture outlining work by Pila **Séminaire de Théorie Des Nombres**

 of Iwasawa theory During the week before the conference in a kind of summer school a series of preparatory lectures for
 young mathematicians was provided as an introduction to Iwasawa theory Iwasawa theory is a modern and powerful branch
 of number theory and can be traced back to the Japanese mathematician Kenkichi Iwasawa who introduced the systematic

Modern Number Theory Yu. I. Manin, Alexei A. Panchishkin, 2006-03-30 This edition has been called startlingly up to date and in this corrected second printing you can be sure that it is even more contemporaneous. It surveys from a unified point of view both the modern state and the trends of continuing development in various branches of number theory. Illuminated by elementary problems, the central ideas of modern theories are laid bare. Some topics covered include non-Abelian generalizations of class field theory, recursive computability and Diophantine equations, zeta and L functions. This substantially revised and expanded new edition contains several new sections such as Wiles' proof of Fermat's Last Theorem and relevant techniques coming from a synthesis of various theories. *My Numbers, My Friends* Paulo Ribenboim, 2006-05-10 This selection of expository essays by Paulo Ribenboim should be of interest to mathematicians from all walks. Ribenboim, a highly praised author of several popular titles, writes each essay in a light and humorous language without secrets, making them thoroughly accessible to everyone with an interest in numbers. This new collection includes essays on Fibonacci numbers, prime numbers, Bernoulli numbers and historical presentations of the main problems pertaining to elementary number theory such as Kummer's work on Fermat's last theorem. *Diophantine Approximation and Transcendence Theory* Gisbert Wüstholz, 2006-11-15 *Arithmetic Algebraic Geometry* G., van der Geer, F. Oort, J.H.M. Steenbrink, 2012-12-06 Arithmetic algebraic geometry is in a fascinating stage of growth, providing a rich variety of applications of new tools to both old and new problems. Representative of these recent developments is the notion of Arakelov geometry, a way of completing a variety over the ring of integers of a number field by adding fibres over the Archimedean places. Another is the appearance of the relations between arithmetic geometry and Nevanlinna theory or, more precisely, between diophantine approximation theory and the value distribution theory of holomorphic maps. Inspired by these exciting developments, the editors organized a meeting at Texel in 1989 and invited a number of mathematicians to write papers for this volume. Some of these papers were presented at the meeting; others arose from the discussions that took place. They were all chosen for their quality and relevance to the application of algebraic geometry to arithmetic problems. Topics include arithmetic surfaces, Chermak functors, modular curves and modular varieties, elliptic curves, Kolyvagin's work, K-theory and Galois representations. Besides the research papers, there is a letter of Parshin and a paper of Zagier with his interpretations of the Birch-Swinnerton-Dyer Conjecture. Research mathematicians and graduate students in algebraic geometry and number theory will find a valuable and lively view of the field in this state-of-the-art selection. **Moment Maps and Combinatorial Invariants of Hamiltonian Tn-spaces** Victor Guillemin, 2012-12-06 The action of a compact Lie group G on a compact symplectic manifold gives rise to some remarkable combinatorial invariants. The simplest and most interesting of these is the moment polytope, a convex polyhedron which sits inside the dual of the Lie algebra of G . One of the main goals of this monograph is to describe what kinds of geometric information are encoded in this polytope. For instance, the first chapter is largely devoted to the Delzant theorem, which says that there is a one-to-one correspondence between certain types of

moment polytopes and certain types of symplectic G spaces One of the most challenging unsolved problems in symplectic geometry is to determine to what extent Delzant's theorem is true of every compact symplectic G Space The moment polytope also encodes quantum information about the actions of G Using the methods of geometric quantization one can frequently convert this action into a representation ρ of G on a Hilbert space and in some sense the moment polytope is a diagrammatic picture of the irreducible representations of G which occur as subrepresentations of ρ Precise versions of this item of folklore are discussed in Chapters 3 and 4 Also midway through Chapter 2 a more complicated object is discussed the Duistermaat Heckman measure and the author explains in Chapter 4 how one can read off from this measure the approximate multiplicities with which the irreducible representations of G occur in ρ This gives an excuse to touch on some results which are in themselves of great current interest the Duistermaat Heckman theorem the localization theorems in equivariant cohomology of Atiyah Bott and Berline Vergne and the recent extremely exciting generalizations of these results by Witten Jeffrey Kirwan Lalkman and others The last two chapters of this book are a self contained and somewhat unorthodox treatment of the theory of toric varieties in which the usual hierarchical relation of complex to symplectic is reversed This book is addressed to researchers

Arithmetic Algebraic Geometry Brian David Conrad, The articles in this volume are expanded versions of lectures delivered at the Graduate Summer School and at the Mentoring Program for Women in Mathematics held at the Institute for Advanced Study Park City Mathematics Institute The theme of the program was arithmetic algebraic geometry The choice of lecture topics was heavily influenced by the recent spectacular work of Wiles on modular elliptic curves and Fermat's Last Theorem The main emphasis of the articles in the volume is on elliptic curves Galois representations and modular forms One lecture series offers an introduction to these objects The others discuss selected recent results current research and open

problems and conjectures The book would be a suitable text for an advanced graduate topics course in arithmetic algebraic geometry
