The Rivers of Wales D. Dudley Williams, Catherine Duigan, 2009 Situated on the western margin of Europe Wales has been moulded by the erosional and depositional power of its fresh waters by virtue of high rainfall interacting with extensive regions of bedrock and post Ice Age glacial debris The result is a still evolving landscape rich in upland bogs springs mountain streams and lakes rivers running through deeply eroded valleys and large lowland rivers meandering across wide floodplains into estuaries and the sea Subsequent chapters bring together for the first time the combined expertise of a group of scientists whose intimate and collective knowledge of the Welsh aquatic landscape is unparalleled The authors begin by describing the knowledge base of these important habitats emphasising the structure and role of their plant animal and microbial communities Upon this are built chapters that review the pioneering role of Welsh river studies in the development of running water science and very poignantly assess the high degree of human alteration of the principality's riverine ecosystems These are followed by chapters that discuss the need for further scientific study management conservation restoration and education so that future impacts on Welsh waters may be understood and minimised Throughout the book flows the underlying theme that there has been and always will be a close link between water resources and the development of Welsh society Publisher's description
