**Seeds** J. Bewley, 2012-12-06 Since the publication of our monograph on seed physiology and biochemistry *The Physiology and Biochemistry of Seeds in Relation to Germination* Springer Verlag 1978 1982 it has been suggested to us that a text covering the same subject area would be appropriate This book is our response Unlike the previous volumes however this text is not intended to be either a critical or a comprehensive account Instead it is a more generalized consideration of the essential aspects of seed physiology and biochemistry as we see them It also includes a

substantial amount of new and different material In a work of this sort it is inevitable that some simplifications must be made but we hope nevertheless that we have presented the most reasonable conspectus of areas of controversy and uncertainty In this respect literature citations have been kept to a minimum and do not interrupt the text they are placed at the end of each chapter and are intended to be used as a source for further references We hope that this book will be of value to students and teachers in universities colleges and other institutes of higher learning whose courses include plant biology Although it is particularly appropriate for studies of seed biology it should also find broader applications in general plant physiology agriculture and horticulture

**Cellular and Molecular Biology of Plant Seed Development** Brian A.

Larkins, Indra K. Vasil, 2013-03-09 The beginnings of human civilization can be traced back to the time nearly 12 000 years ago when the early humans gradually changed from a life of hunting and gathering food to producing food This beginning of primitive agriculture ensured a dependable supply of food and fostered the living together of people in groups and the development of society During this time plant seeds were recognized as a valuable source of food and nutrition and began to be used for growing plants for food Ever since plant seeds have played an important role in the development of the human civilization Even today seeds of a few crop species such as the cereals and legumes are the primary source of most human food and the predominant commodity in international agriculture Owing to their great importance as food for humans and in international trade seeds have been a favorite object of study by developmental biologists and physiologists nutritionists and chemists A wealth of useful information is available on the biology of seeds

*Seed Development: OMICS Technologies toward Improvement of Seed Quality and Crop Yield* Ganesh K. Agrawal, Randeep Rakwal, 2012-12-09 The book is about the seed development in the model and crop plants Seed development is a key step of the plant life cycle that determines the nutrient value of seeds the life for human civilization growth and development The nutrient value of seeds is mainly due to storage reserve products such as carbohydrates lipids triacylglycerols and proteins The book primarily focuses on application of the 21st century high throughput technologies transcriptomics proteomics metabolomics and systems biology in near complete understanding of the various processes involved in seed development in different crop plants The book reveals how such technologies have revolutionized our understanding of the multilayer processes and regulations involved therein by generating large scale datasets Accumulated datasets provide basic knowledge to develop integrated strategies to eventually improve the nutritional value of plant seed and crop yield a critical goal in food security issues around the globe

**Annual Plant Reviews, Seed Development, Dormancy and Germination** Kent

Bradford, Hiro Nonogaki, 2008-04-15 The formation dispersal and germination of seeds are crucial stages in the life cycles of gymnosperm and angiosperm plants The unique properties of seeds particularly their tolerance to desiccation their mobility and their ability to schedule their germination to coincide with times when environmental conditions are favorable to their survival as seedlings have no doubt contributed significantly to the success of seed bearing plants Humans are also

dependent upon seeds which constitute the majority of the world's staple foods e.g. cereals and legumes. Seeds are an excellent system for studying fundamental developmental processes in plant biology as they develop from a single fertilized zygote into an embryo and endosperm in association with the surrounding maternal tissues. As genetic and molecular approaches have become increasingly powerful tools for biological research, seeds have become an attractive system in which to study a wide array of metabolic processes and regulatory systems. Seed Development, Dormancy and Germination provides a comprehensive overview of seed biology from the point of view of the developmental and regulatory processes that are involved in the transition from a developing seed through dormancy and into germination and seedling growth. It examines the complexity of the environmental, physiological, molecular and genetic interactions that occur through the life cycle of seeds along with the concepts and approaches used to analyze seed dormancy and germination behavior. It also identifies the current challenges and remaining questions for future research. The book is directed at plant developmental biologists, geneticists, plant breeders, seed biologists and graduate students.

**Omics in Seed Development: Challenges and Opportunities for Improving of Seed Quality and Yield in Model and Crop Plants** Daoquan Xiang, Zhaorong Hu, Raju Datla, 2025-03-06. Seed development represents an important phase of the life cycle in sexually reproducing plant species. A seed is a complex organ system of three components: the embryo that contributes to germline continuity, endosperm for nourishment and the seed coat for protection. The developmental programs and the associated events that culminate in the production of a mature seed are highly complex and require precisely coordinated integration of the genetic, molecular, biochemical, metabolic and physiological pathways and their interactions with environmental cues. Research advances in seed development using model and crop species such as Arabidopsis, rice, maize, wheat and Brassica species have uncovered several key genes and pathways that regulate the cell and tissue specification, differentiation and growth programs. The key findings from these studies are helping to develop a framework for advancing the knowledge and understanding of the process and the underpinning molecular mechanisms of an embryo, endosperm and seed coat development. However, knowledge gaps still exist in understanding the regulating networks and metabolic programs involved in defining several important seed traits associated with seed quality and yield, especially in crop plants. Continued rapid advances in omics technologies have contributed to the development of several critical tools for performing genome, epigenome, transcriptome, proteome and metabolome studies and their applications in seed development. Bioinformatics and computational tools are also playing important contributions in the large-scale genome-wide systems level analysis, modeling and predictions to identify and characterize the underpinning mechanisms that support seed formation. A holistic understanding of the complexities and interactions that drive seed development is becoming increasingly possible with the application of omics tools to decipher gene, protein and metabolite networks. In the proposed Research Topic, we highlight current advances in genomics, proteomics, lipidomics, metabolomics, metagenomics, transcriptomics and phenomics studies of seed development in

both model and crop species We aim to further elucidate how these key genetic regulators and pathway genes act together to control cell division patterning differentiation and storage reserve accumulation during seed development how these critical processes coordinate to define the seed as a whole and how the genetic and regulatory networks function to generate tremendous natural diversity in the size number and compositional aspects of plant seeds      **Seeds Handbook** Babasaheb B. Desai, 2004-04-22 Revised and expanded throughout this latest edition of the bestselling Seeds Handbook Biology Production Processing and Storage includes valuable information on all areas of seed biology production and processing The author one of the most respected and prolific scientists in the field identifies current developments in seed testing and certification storage transportation and distribution Tracking the evolution and advancement of seed industries and technologies he fully covers the development and supply of high quality seeds for every key agronomic and horticulture crop Contains methods to enhance the genetic and physiological characteristics of more than 80 major and minor crops With an abundance of current research and additional figures and illustrations this edition of the Seeds Handbook offers chapters on modern biotechnological issues such as the production of synthetic seeds loss reduction biotechnologies and new strategies in the seed production industry It provides in depth information on burgeoning areas of seed science including tissue culture and cellular totipotency induction and regeneration protocols development and maturation hormone requirements drying and storage of somatic embryos protective encapsulation and crop applications With an eye to the future it looks at challenges in the provision and enhancement of seeds for crop plants practical methods of seed production and micropropagation genetically modified seeds and world food security      *Advances in Seed Biology* Paolo A. Sabelli, Brian A. Larkins, 2015-11-11 The seed plays a fundamental role in plant reproduction as well as a key source of energy nutrients and raw materials for developing and sustaining humanity With an expanding and generally more affluent world population projected to reach nine billion by mid century coupled to diminishing availability of inputs agriculture is facing increasing challenges to ensure sufficient grain production A deeper understanding of seed development evolution and physiology will undoubtedly provide a fundamental basis to improve plant breeding practices and ultimately crop yields Recent advances in genetic biochemical molecular and physiological research mostly brought about by the deployment of novel high throughput and high sensitivity technologies have begun to uncover and connect the molecular networks that control and integrate different aspects of seed development and help determine the economic value of grain crops with unprecedented details The objective of this e book is to provide a compilation of original research articles reviews hypotheses and perspectives that have recently been published in *Frontiers in Plant Science Plant Evolution and Development* as part of the Research Topic entitled *Advances in Seed Biology* Editing this Research Topic has been an extremely interesting educational and rewarding experience and we sincerely thank all authors who contributed their expertise and in depth knowledge of the different topics discussed We hope that the information presented here will help to establish the state of the art of this field and will convey how exciting and

important studying seeds is and hopefully will stimulate a new crop of scientists devoted to investigating the biology of seeds
