Loss Reserving An Actuarial Perspective:

Loss Reserving Gregory Taylor, 2012-12-06 All property and casualty insurers are required to carry out loss reserving as a statutory accounting function. Thus loss reserving is an essential sphere of activity and one with its own specialized body of knowledge. While few books have been devoted to the topic, the amount of published research literature on loss reserving has almost doubled in size during the last fifteen years. Greg Taylor's book aims to provide a comprehensive state of the art treatment of loss reserving that reflects contemporary research advances to date. Divided into two parts, the book covers both the conventional techniques widely used in practice and more specialized loss reserving techniques employing stochastic models. Part I: Deterministic Models covers very practical issues through the abundant use of numerical examples that fully develop the techniques under consideration. Part II: Stochastic Models begins with a chapter that sets up the additional theoretical material needed to illustrate stochastic modeling. The remaining chapters in Part II are self-contained and thus can be approached independently of each other. A special feature of the book is the use throughout of a single real life data set to illustrate the numerical examples and new techniques presented. The data set illustrates most of the difficult situations presented in actuarial practice. This book will meet the needs for a reference work as well as for a textbook on loss reserving.

Predictive Modeling Applications in Actuarial Science Edward W. Frees, Richard A. Derrig, Glenn Meyers, 2014-07-28 This book is for actuaries and financial analysts developing their expertise in statistics and who wish to become familiar with concrete examples of predictive modeling.

Predictive Modeling Applications in Actuarial Science: Volume 1, Predictive Modeling Techniques Edward W. Frees, Richard A. Derrig, Glenn Meyers, 2014-07-28 Predictive modeling involves the use of data to forecast future events. It relies on capturing relationships between explanatory variables and the predicted variables from past occurrences and exploiting this to predict future outcomes. Forecasting future financial events is a core actuarial skill; actuaries routinely apply predictive modeling techniques in insurance and other risk management applications. This book is for actuaries and other financial analysts who are developing their expertise in statistics and wish to become familiar with concrete examples of predictive modeling. The book also addresses the needs of more seasoned practising analysts who would like an overview of advanced statistical topics that are particularly relevant in actuarial practice. Predictive Modeling Applications in Actuarial Science emphasizes lifelong learning by developing tools in an insurance context, providing the relevant actuarial applications and introducing advanced statistical techniques that can be used by analysts to gain a competitive advantage in situations with complex data.

Claims Reserving in General Insurance David Hindley, 2017-10-26 This is a single comprehensive reference source covering the key material on this subject and describing both theoretical and practical aspects.

Handbook on Loss Reserving Michael Radtke, Klaus D. Schmidt, Anja Schnaus, 2016-10-26 This handbook presents the basic aspects of actuarial loss reserving. Besides the traditional methods, it also includes a description of more recent ones and a discussion of certain problems occurring in

actuarial practice like inflation scarce data large claims slow loss development the use of market statistics the need for simulation techniques and the task of calculating best estimates and ranges of future losses In property and casualty insurance the provisions for payment obligations from losses that have occurred but have not yet been settled usually constitute the largest item on the liabilities side of an insurer's balance sheet For this reason the determination and evaluation of these loss reserves is of considerable economic importance for every property and casualty insurer Actuarial students academics as well as practicing actuaries will benefit from this overview of the most important actuarial methods of loss reserving by developing an understanding of the underlying stochastic models and how to practically solve some problems which may occur in actuarial practice

Stochastic Claims Reserving Methods in Insurance Mario V. Wüthrich, Michael Merz, 2008-04-30 Claims reserving is central to the insurance industry Insurance liabilities depend on a number of different risk factors which need to be predicted accurately This prediction of risk factors and outstanding loss liabilities is the core for pricing insurance products determining the profitability of an insurance company and for considering the financial strength solvency of the company Following several high profile company insolvencies regulatory requirements have moved towards a risk adjusted basis which has led to the Solvency II developments The key focus in the new regime is that financial companies need to analyze adverse developments in their portfolios Reserving actuaries now have to not only estimate reserves for the outstanding loss liabilities but also to quantify possible shortfalls in these reserves that may lead to potential losses Such an analysis requires stochastic modeling of loss liability cash flows and it can only be done within a stochastic framework Therefore stochastic loss liability modeling and quantifying prediction uncertainties has become standard under the new legal framework for the financial industry This book covers all the mathematical theory and practical guidance needed in order to adhere to these stochastic techniques Starting with the basic mathematical methods working right through to the latest developments relevant for practical applications readers will find out how to estimate total claims reserves while at the same time predicting errors and uncertainty are quantified Accompanying datasets demonstrate all the techniques which are easily implemented in a spreadsheet A practical and essential guide this book is a must read in the light of the new solvency requirements for the whole insurance industry

Bayesian Claims Reserving Methods in Non-life Insurance with Stan Guangyuan Gao, 2018-12-31 This book first provides a review of various aspects of Bayesian statistics It then investigates three types of claims reserving models in the Bayesian framework chain ladder models basis expansion models involving a tail factor and multivariate copula models For the Bayesian inferential methods this book largely relies on Stan a specialized software environment which applies Hamiltonian Monte Carlo method and variational Bayes

Claim Models Greg Taylor, 2020-04-15 This collection of articles addresses the most modern forms of loss reserving methodology granular models and machine learning models New methodologies come with questions about their applicability These questions are discussed in one article which focuses on the relative merits of granular and machine learning models

Others illustrate applications with real world data The examples include neural networks which though well known in some disciplines have previously been limited in the actuarial literature This volume expands on that literature with specific attention to their application to loss reserving For example one of the articles introduces the application of neural networks of the gated recurrent unit form to the actuarial literature whereas another uses a penalized neural network Neural networks are not the only form of machine learning and two other papers outline applications of gradient boosting and regression trees respectively Both articles construct loss reserves at the individual claim level so that these models resemble granular models One of these articles provides a practical application of the model to claim watching the action of monitoring claim development and anticipating major features Such watching can be used as an early warning system or for other administrative purposes Overall this volume is an extremely useful addition to the libraries of those working at the loss reserving frontier

Predictive Modeling Applications in Actuarial Science: Volume 2, Case Studies in Insurance

Edward W. Frees, Glenn Meyers, Richard A. Derrig, 2016-07-27 Predictive modeling uses data to forecast future events It exploits relationships between explanatory variables and the predicted variables from past occurrences to predict future outcomes Forecasting financial events is a core skill that actuaries routinely apply in insurance and other risk management applications Predictive Modeling Applications in Actuarial Science emphasizes life long learning by developing tools in an insurance context providing the relevant actuarial applications and introducing advanced statistical techniques that can be used to gain a competitive advantage in situations with complex data Volume 2 examines applications of predictive modeling Where Volume 1 developed the foundations of predictive modeling Volume 2 explores practical uses for techniques focusing on property and casualty insurance Readers are exposed to a variety of techniques in concrete real life contexts that demonstrate their value and the overall value of predictive modeling for seasoned practicing analysts as well as those just starting out

Modern Actuarial Risk Theory Rob Kaas, Marc Goovaerts, Jan Dhaene, Michel Denuit, 2008-08-17 Modern Actuarial Risk Theory contains what every actuary needs to know about non life insurance mathematics It starts with the standard material like utility theory individual and collective model and basic ruin theory Other topics are risk measures and premium principles bonus malus systems ordering of risks and credibility theory It also contains some chapters about Generalized Linear Models applied to rating and IBNR problems As to the level of the mathematics the book would fit in a bachelors or masters program in quantitative economics or mathematical statistics This second and much expanded edition emphasizes the implementation of these techniques through the use of R This free but incredibly powerful software is rapidly developing into the de facto standard for statistical computation not just in academic circles but also in practice With R one can do simulations find maximum likelihood estimators compute distributions by inverting transforms and much more
