Latek, Hamid Yousf Dar, Yildiz Tutuncu, 2025-09-23 An adequate and balanced response to pathogenic factors is one of the conditions that determine the survival of an individual a population or even an entire species Clinical data collected during the COVID 19 pandemic showed that a patients resistance varied depending on their levels of well known endocrine system regulators e g vitamin D In addition the imbalance of hormonal milieu in women increases the prevalence rate for autoimmune diseases compared to men whilst exposure to endocrine disruptors negatively affects the development of the immune system in offspring leading to later health defects All of the above proves that understanding the linkage between the endocrine and immune system is necessary to propose new therapeutic strategies helping improve the lives of those with disease and illness It is known that restoring the endocrine system balance through ligand mediated modulation of GPCR signaling improves the functioning of both innate and adaptive immune systems Thus an excessive immune response demonstrated that acute or chronic inflammation can be controlled differently than through commonly used immunosuppressive drugs There is therefore much more to be discovered from learning the relationship between these two systems **Design & Technology** Maggie Rogers, 2002 Nelson Thornes Primary ICT Handbooks enable primary teachers to

Alternative Splicing in Brain Function Kif Liakath-Ali, Matthias Soller, 2023-12-13 Functional and structural intricacies of biological systems emerge from the complex nature of the genome A key aspect of genome complexity can be attributed to the process of alternative splicing of precursor mRNA or pre mRNA during which introns are removed and exons are selectively spliced together This highly regulated process generates different mature mRNA transcripts from a single gene and is widespread throughout the eukaryotic evolution The majority of the genes expressed in the mammalian central nervous system undergo extensive alternative splicing Some genes can generate more than a thousand isoforms resulting in diverse proteoforms that can differ in their function binding preference catalytic activity and localization Perturbation in alternative splicing has been linked to many neurological disorders Despite its significance we still lack a comprehensive understanding of its role in neuronal function Recent studies suggest that alternative splicing is a regulator of tissue identity and development This is particularly relevant to the brain where developmental regulation and heterogenous cell population play a crucial role in shaping its function For a long time technological limitations in detecting and measuring alternatively spliced transcripts hindered the progress in understanding the biology of alternative splicing Recent advances in long read and native mRNA sequencing and robust computational tools allow us to capture and quantify in their full length form Public transcriptomics datasets can be utilized for the meta analysis of alternative splicing landscapes of various experimental conditions and disease samples In addition protein isoform detection complements mRNA isoform levels Given its biological significance and recent advances the objective of this Research Topic is to assemble current knowledge views and challenges in the studies of alternative splicing in brain function
