

Ventricular Paced Rhythms

VVI Pacemaker One lead in right ventricle. Ventricle is paced, ventricle is sensed, pacemaker output is inhibited in response to sensing.	Regularity: regular unless intrinsic beats are present. Rate: depends on rate of intrinsic rhythm and set rate of pacemaker. P waves: present in sinus rhythm but unrelated to paced beats. PR Intervals: not related to paced beats. QRS Width: wide on paced beats (>12 sec or more). Captures: pacemaker output results in depolarization of ventricle. Sensing: pacemaker sees and responds to intrinsic ventricular activity.	VVI pacing with good capture. Cannot evaluate sensing because there is no intrinsic activity to sense. 
Loss of Capture Pacemaker spikes not followed by paced QRS.	Pacemaker output does not result in depolarization of ventricle. Pacemaker spikes are seen but are not followed by paced QRS. Loss of capture can be complete or intermittent. Loss of capture is an emergency in pacemaker dependent patients. Increase stimulus strength (mA) or reposition patient until lead can be repositioned.	Intermittent loss of capture: 
Loss of Sensing Pacemaker does not inhibit its output when intrinsic beats are present.	Pacemaker fails to see intrinsic ventricular beats so does not inhibit pacemaker output. Results in pacing close to T waves and can cause VT or VF. Increase sensitivity (set to smaller mV setting)	Complete loss of capture. Underlying rhythm is atrial fibrillation with KBBB. 
		Two intrinsic beats are not sensed  PVC not sensed
