between inputs and outputs constant over time In most realistic application domains this assumption is violated and both the normal intended function of the device and the potential malfunctions are complex behaviors over time This book addresses the problem of systematically treating information about fault symptoms that are spread out over periods of time These symptoms are characterized by a specific order of events and in the general case a single snapshot of the device state does not suffice to recognize the symptoms Instead one has to plan a measurement sequence that consists of several observations at more than one time point Starting with a classification of various types of dynamic faulty behavior the author identifies temporally distributed systems TDSs and designs a representation language that allows TDSs to be specified in a declarative manner The definition of a successful match of a measurement sequence against a TDS specification is operationalized as an algorithm which plans such an observation sequence based on the TDS specification The author demonstrates that his novel solution is a generic paradigm independent building block for diagnostic expert systems by embedding it into the frameworks of both an associative and a model based diagnostic system The book will be valuable both for researchers working on applications of temporal reasoning and prospective users of technical expert systems *Algorithms and Architectures for Real-Time Control* 1992 P.J. Fleming,W.H. Kwon,2014-05-23 This Workshop focuses on such issues as control algorithms which are suitable for real time use computer architectures which are suitable for real time control algorithms and applications for real time control issues in the areas of parallel algorithms multiprocessor systems neural networks fault tolerance systems real time robot control identification real time filtering algorithms control algorithms fuzzy control adaptive and self tuning control and real time control applications **Distributed Computing** Nancy A. and extend the debate concerning the significance of connectionist models The volume collects together a variety of perspectives by experimental and developmental psychologists philosophers and active AI researchers These contributions relate connectionist ideas to historical psychological debates e g over behaviourism and associationism to developmental and philosophical issues The result is a volume which addresses both familiar but central topics such as the relation between connectionism and classical AI and less familiar but highly challenging topics such as connectionism associationism and behaviourism the distinction between perception and cognition the role of environmental structure and the potential value of connectionism as a means of symbol grounding The nine essays have been written with an interdisciplinary audience in mind and avoid both technical jargon and heavy mathematics

Distributed Algorithms for Message-Passing Systems Michel

Raynal, 2013-06-29 Distributed computing is at the heart of many applications It arises as soon as one has to solve a problem in terms of entities such as processes peers processors nodes or agents that individually have only a partial knowledge of the many input parameters associated with the problem In particular each entity cooperating towards the common goal cannot have an instantaneous knowledge of the current state of the other entities Whereas parallel computing is mainly concerned with efficiency and real time computing is mainly concerned with on time computing distributed computing is mainly concerned with mastering uncertainty created by issues such as the multiplicity of control flows asynchronous communication unstable behaviors mobility and dynamicity While some distributed algorithms consist of a few lines only their behavior can be difficult to understand and their properties hard to state and prove The aim of this book is to present in a comprehensive way the basic notions concepts and algorithms of distributed computing when the distributed entities

cooperate by sending and receiving messages on top of an asynchronous network The book is composed of seventeen chapters structured into six parts distributed graph algorithms in particular what makes them different from sequential or parallel algorithms logical time and global states the core of the book mutual exclusion and resource allocation high level communication abstractions distributed detection of properties and distributed shared memory The author establishes clear objectives per chapter and the content is supported throughout with illustrative examples summaries exercises and annotated bibliographies This book constitutes an introduction to distributed computing and is suitable for advanced undergraduate students or graduate students in computer science and computer engineering graduate students in mathematics interested in distributed computing and practitioners and engineers involved in the design and implementation of distributed applications The reader should have a basic knowledge of algorithms and operating systems
