

# Radioimmunoassay (RIA)

- Used to measure concentration of an antigen by use of antibody
- **Procedure:** A known quantity of an antigen is made radioactive, by labeling it with radioactive isotopes of iodine ( $^{125}\text{I}$ )
- The radiolabeled antigen is then mixed with a known amount of antibody for that antigen.
- Antigen antibody bind to each other.
- Then, a sample of serum from a patient containing an unknown quantity of that same antigen is added.
- This causes the unlabeled antigen from the serum to compete with the radiolabeled antigen for antibody binding sites.

**Metabolic Control in Diabetes Mellitus Beta Adrenoceptor Blocking Drugs NMR Analysis of Cancer Cells Immunoassay in the Clinical Laboratory Cyclosporine**, 2012-12-06

The close association between blood glucose control and the well being of the patient as well as the risk for the development of the late complications of 3 diabetes make it necessary to attain near normalisation of blood glucose. Significant progress has been made in this direction in the last few years because of the advancement of analytical techniques for the monitoring of both metabolic status and the functional state of the pancreas and the kidneys organs involved in the disease process The respective methodologies are the test strips for self monitoring of glucose in blood and urine the measurement of the nonenzymatic glycosylation of hemoglobin and serum proteins the C peptide assay and the determination of small amounts of albumin in urine The test strip methodology for determination of glucose in blood and urine has made possible home blood glucose monitoring which enables the patient to aim for treatment targets near the physiological range To this information on short term glycemia obtained by the patient the determination of hemoglobin glycosylation in the clinical chemistry laboratory adds quantitative information about averaged long term glycemic control The C peptide assay allows evaluation of the residual pancreatic function in the presence of exogenous insulin Results of a C peptide assay are helpful in selecting the appropriate treatment for poorly controlled maturity onset diabetes The detection of microalbuminuria an abnormal albumin excretion below the level of Albustix detection establishes nephropathy before renal damage becomes irreversible
