Power Electronics and Control Techniques for Maximum Energy Harvesting in Photovoltaic Systems Nicola Femia, Giovanni Petrone, Giovanni Spagnuolo, Massimo Vitelli, 2017-07-12 Incentives provided by European governments have resulted in the rapid growth of the photovoltaic PV market. Many PV modules are now commercially available and there are a number of power electronic systems for processing the electrical power produced by PV systems especially for grid connected applications. Filling a gap in the literature, *Power Electronics and Control Techniques for Maximum Energy Harvesting in Photovoltaic Systems* brings together research on control circuits, systems and techniques dedicated to the maximization of the electrical power produced by a photovoltaic PV source. Tools to Help You Improve the Efficiency of Photovoltaic Systems. The book supplies an overview of recent improvements in connecting PV systems to the grid and highlights various solutions that can be used as a starting point for further research and development. It begins with a review of methods for modeling a PV array working in uniform and mismatched conditions. The book then discusses several ways to achieve the best maximum power point tracking (MPPT) performance. A chapter focuses on MPPT efficiency, examining the design of the parameters that affect algorithm performance. The authors also address the maximization of the energy harvested in mismatched conditions in terms of both power architecture and control algorithms and discuss the distributed MPPT approach. The final chapter details the design of DC/DC converters which usually perform the MPPT function with special emphasis on their energy efficiency. Get Insights from the Experts on How to Effectively Implement MPPT. Written by well known researchers in the field of photovoltaic systems, this book tackles state of the art issues related to how to extract the maximum electrical power from photovoltaic arrays under any weather condition. Featuring a wealth of examples and illustrations, it offers practical guidance for researchers and industry professionals who want to implement MPPT in photovoltaic systems.

Robust Control in Power Systems Bikash Pal, Balarko Chaudhuri, 2006-07-02 Robust Control in Power Systems deals with the applications of new techniques in linear system theory to control low frequency oscillations in power systems. The book specifically focuses on the analysis and damping of inter area oscillations in the systems which are in the range of 0.2-1 Hz. The damping control action is injected through high power electronic devices known as flexible AC transmission system (FACTS) controllers. Three commonly used FACTS controllers: controllable series capacitors (CSCs), controllable phase shifters (CPSs) and static var compensators (SVCs) have been used in this book to control the inter area oscillations. The overview of linear system theory from the perspective of power system control is explained through examples. The damping control design is formulated as a norm optimization problem. The H_∞ and H_2 norm of properly defined transfer functions are minimized in linear matrix inequalities (LMI) framework to obtain desired performance and stability robustness. Both centralized and decentralized control structures are used. Usually the transmission of feedback signal from a remote location encounters delays making it

difficult to control the system Smith predictor based approach has been successfully explored in this book as a solution to such a problem Robust Control in Power Systems will be valuable to academicians in the areas of power control and system theory as well as professionals in the power industry **Neural and Fuzzy Logic Control of Drives and Power Systems**
