Rotors: Stress Analysis and Design Vincenzo

Vullo,Francesco Vivio,2013-04-09 Stress and strain analysis of rotors subjected to surface and body loads as well as to

thermal loads deriving from temperature variation along the radius constitutes a classic subject of machine design

Nevertheless attention is limited to rotor profiles for which governing equations are solvable in closed form Furthermore

very few actual engineering issues may relate to structures for which stress and strain analysis in the linear elastic field and

even more under non linear conditions i e plastic or viscoelastic conditions produces equations to be solved in closed form

Moreover when a product is still in its design stage an analytical formulation with closed form solution is of course simpler

and more versatile than numerical methods and it allows to quickly define a general configuration which may then be fine

tuned using such numerical methods In this view all subjects are based on analytical methodological approach and some new

solutions in closed form are presented The analytical formulation of problems is always carried out considering actual

engineering applications Moreover in order to make the use of analytical models even more friendly at the product design

stage a function is introduced whereby it is possible to define a fourfold infinity of disk profiles solid or annular concave or

convex converging or diverging Such subjects even derived from scientific authors contributions are always aimed at

designing rotors at the concept stage i e in what precedes detailed design Among the many contributions a special mention is

due for the following linear elastic analysis of conical disks and disks with variable profile along its radius according to a

power of a linear function also subjected to thermal load and with variable density analysis of a variable profile disk

subjected to centrifugal load beyond the material s yield point introducing the completely general law expressed by a an n

graded polynomial linear elastic analysis of hyperbolic disk subjected to thermal load along its radius linear elastic analysis of a

variable thickness disk according to a power of a linear function subjected to angular acceleration etc
