Coherent Flow Structures at Earth's Surface Jeremy G. Venditti,James L. Best,Michael Church,Richard J. Hardy,2013-08-28 An expert review of recent progress in the study of turbulent flows with a focus on recently identified organized structures This book reviews the recent progress in the study of the turbulent flows that sculpt the Earth's surface focusing in particular on the organized structures that have been identified in recent years within turbulent flows These coherent flow structures can include eddies or vortices at the scale of individual grains through structures that scale with the flow depth in rivers or estuaries to the large scale structure of flows at the morphological or landform scale These flow structures are of wide interest to the scientific community because they play an important role in fluid dynamics and

influence the transport erosion and deposition of sediment and pollutants in a wide variety of fluid flow environments Scientific knowledge of these structures has improved greatly over the past 20 years as computational fluid dynamics has come to play an increasing important part in building our understanding of coherent flow structures across a broad range of scales Chapters comprise a series of major invited papers and a selection of the most novel innovative papers presented at the second Coherent Flow Structures Conference held August 3 5 2011 at Simon Fraser University in Burnaby British Columbia Chapters focus on six major themes Dynamics of coherent flow structures CFS in geophysical flows Interaction of turbulent flows vegetation and ecological habitats Coherent structure of atmospheric flows Numerical modeling of coherent flow structures Turbulence in open channel flows Coherent flow structures sediment transport and morphological feedbacks

Large Eddy Simulations of Canopy Flows Over Complex Terrain Yulong Ma, 2019 Forest canopies cover about 30% of the land surfaces some of which are hilly or mountainous Both complex terrain and forest canopies influence mean flow and turbulence playing a critical role in affecting momentum and scalar transfer Although recent advances have been made in numerical simulations of canopy flows few have been conducted over steep slope terrain and considered full sets of physical and physiological processes in sub canopy layers which greatly limits our understanding of canopy flows and scalar transfer To address this limitation we upgrade the Weather Research and Forecasting model with the large eddy simulations module WRF LES by incorporating the immersed boundary method IBM to improve the simulations over steep slope terrain In addition an advanced multiple layer canopy module MCANOPY is developed based largely on the Community Land Model version 4 5 and coupled with WRF LES to simulate sources and or sinks of momentum heat water vapor and CO₂ across multiple canopy layers Both IBM and MCANOPY are evaluated against field measurements demonstrating good performances compared with observations The updated modeling system i e WRF LES IBM MCANOPY is then applied over a forest edge to investigate the effects of foliage distributions and scalar distributions on canopy flows and scalar transfer The results show that foliage distributions have a significant impact on the flow dynamics and scalar transfer mainly due to the sub canopy jet The scalar distributions affect the scalar field with the ground source being the most important The modeling system also simulates flows over forested hills Flow dynamics over a three dimensional hill show a different feature to those over a two dimensional hill where much large turbulence structures are simulated in the lee of a three dimensional hill Simulations over different slope hills demonstrate significant impacts of slopes The lee side turbulence is enhanced as the hill slope increases A new flow feature is the nearly unvarying flow field within the canopy in the lee of a steep slope hill subjected to the influence of foliage distributions Our upgraded WRF LES IBM MCANOPY system has demonstrated promising capacities in many applications such as wind turbine siting wildfire propagation prediction and interpretation of eddy covariance data over complex landscapes

Small Scale Processes in Geophysical Fluid Flows Lakshmi H. Kantha, Carol Anne Clayson, 2000-08-07 While ocean waves are the most visible example of oceanic mixing processes this

macroscale mixing process represents but one end of the spectrum of mixing processes operating in the ocean. At the scale of a typical phytoplanktonic diatom or larval fish inhabiting these seas the most important mixing processes occur on the molecular scale at the scale of turbulence. Physical biological interactions at this scale are of paramount importance to the productivity of the seas, fisheries and the heat balance that controls large scale ocean climate phenomena such as El Niño and tornadoes. This book grew out of the need for a comprehensive treatment of the diverse elements of geophysical fluid flow at the microscale. Kantha and Clayson have arranged a logical exposition of the various mixing processes operating within and between the oceans and its boundaries with the atmosphere and ocean floor. The authors' intent is to develop a volume that would provide a comprehensive treatment of the fundamental elements of ocean mixing so that students, academics and professional fluid dynamicists and oceanographers can access this essential information from one source. This volume will serve as both a valuable reference tool for mathematically inclined limnologists, oceanographers and fluid modelers. Simple models of oceanic and atmospheric boundary layers are discussed. Comprehensive and up to date review. Useful for graduate level course. Essential for modeling the oceans and the atmosphere. Color Plates. *Saturated Flow and Soil Structure* Heiko Diestel, 2012-12-06. Soil and water pollution have a serious impact on the environment and soil scientists and hydrologists need fundamental help for the estimation of the consequences. The experiments described in this volume deal with the quantification of the morphology of interaggregate voids and of the flow through such voids as well as around impermeable inclusions. The diagrams given in the appendix can be used as references for such measurements. This work is put into the context of the international literature on the subject. An index and a glossary complete the volume. The subject of this work is of great interest to hydrologists and soil scientists working on the estimation of the consequences of soil and water pollution.

Flow and Transport Processes with Complex Obstructions Yevgeny A. Gayev, Julian C.R. Hunt, 2007-02-06. The NATO Advanced Study Institute Flow and Transport Processes in Complex Structured Geometries from cities and vegetative canopies to engineering problems was held in Kyiv, Ukraine in the period of May 4-15, 2004. This book, based on the papers presented there, provides an overview of this new area in fluid mechanics and its applications that have developed over the past three decades. The subject, whose origins lie both in theory and in practice, is now rapidly developing in many directions. The focus of applied fluid mechanics research has steadily been shifting from engineering to environmental applications. In both fields there has been great interest in the study of flows around obstacles, initially single isolated obstacles and then groups together with the effects of nearby resistive surfaces such as the walls of a pipe, the ground or a free surface in hydraulics. Simplified theoretical analysis began with studies of axisymmetric and cylindrical free mounted bodies. However, other methods had to be used for quantifying the complete flow fields past arbitrary bluff bodies, either by using experiments or when powerful computers became available by direct calculation and solution of the full equations of fluid dynamics. In most practical cases the Reynolds numbers are too large to compute all the small scale eddy motions which therefore have to be described statistically.

[Footprints in Micrometeorology and Ecology](#) Monique Y. Leclerc, Thomas Foken, 2014-06-17 How to interpret meteorological measurements made at a given level over a surface with regard to characteristic properties such as roughness albedo heat moisture carbon dioxide and other gases is an old question which goes back to the very beginnings of modern micrometeorology It is made even more challenging when it is unclear whether these measurements are only valid for this point region and precisely describe the conditions there or if they are also influenced by surrounding areas After 50 years of field experiments it has become both apparent and problematic that meteorological measurements are influenced from surfaces on the windward side As such extending these measurements for inhomogeneous experimental sites requires a

quantitative understanding of these influences When combined with atmospheric transport models similar to air pollution models the footprint concept a fundamental approach introduced roughly 20 years ago provides us with information on whether or not the condition of upwind site homogeneity is fulfilled Since these first models the development of more scientifically based versions validation experiments and applications has advanced rapidly The aim of this book is to provide an overview of these developments to analyze present deficits to describe applications and to advance this topic at the forefront of micrometeorological research *Informatics, Networking and Intelligent Computing* Jiaying Zhang, 2015-05-06
