Advances in Swine in Biomedical Research L.B. Schook, M.E. Tumbleson, 2013-03-07 Similarities in structure and function between pigs and human beings include size feeding patterns digestive physiology dietary habits kidney structure and function pulmonary vascular bed structure

coronary artery distribution propensity to obesity respiratory rates tidal volumes and social behaviors Since the pig is an omnivore it provides an adaptable model to evaluate chronic and acute exposures to xenobiotics such as alcohol caffeine tobacco food additives and environmental pollutants Swine have been used successfully as models to evaluate alcoholism diabetes absorption digestion total parenteral nutrition organ transplantation atherosclerosis exercise hypertension hemorrhagic hypotension melanoma gingivitis obstructive and reflux nephropathy osteochondrosis dermal healing and septic shock A severe and worsening shortage of organs and tissues for transplantation in patients with severe organ failure has encouraged the consideration of inter species or xenotransplantation In developing programs toward this end the pig generally is viewed as the preferred donor because of its size physiology and availability The pig harbors relatively few diseases which could be transmitted inadvertently to human patients The ability to genetically modify swine to ameliorate the consequences of the human immune response offers a further significant advantage Another important consideration for an animal model is that basic biologic background information be available for investigators to design future prospective studies
