SOFTWARE DESIGN AND STRUCTURING

Barry W. Boehm

INTRODUCTION

In 1974, the major leverage point in the software process is at the software design and structuring stage. This stage begins with a statement of software requirements. Properly done, the software design and structuring process can identify the weak spots and mismatches in the requirements statement which are the main sources of unresponsiveness of delivered software. Once these weak spots slip by the design phase, they will generally stay until during or after delivery, where only costly retrofits can make the software responsive to operational needs.

The software design and structuring phase ends with a detailed specification of the code that is to be produced, a plan for testing the code, and a draft set of users' manuals describing how the product is going to be used. Software costs and problems result from allowing coding to begin on a piece of software before its design aspects have been thoroughly worked out, verified, and validated. Figure 1 illustrates this quite well. It summarizes an analysis of 220 types of software errors found during a large, generally good (on-cost, on-schedule delivery) TRW software project [19, 20]. The great majority of the types of errors found in testing the code had originated in the design phase. Even more significantly, the design errors are generally not found until later in the test process. Of the 54 percent of the error types which were typically not found until during or after the acceptance test phase, only 9 percent were coding errors. The other 45 percent were design errors.

Specification and Transformation of Programs Helmut A.

Partsch,2012-12-06 Specification and transformation of programs is short for a methodology of software development where from a formal specification of a problem to be solved programs correctly solving that problem are constructed by stepwise application of formal semantics preserving transformation rules The approach considers programming as a formal activity Consequently it requires some mathematical maturity and above all the will to try something new A somewhat experienced programmer or a third or fourth year student in computer science should be able to master most of this material at least this is the level I have aimed at This book is primarily intended as a general introductory textbook on transformational methodology As with any methodology reading and understanding is necessary but not sufficient Therefore most of the chapters contain a set of exercises for practising as homework Solutions to these exercises exist and can in principle be obtained at nominal cost from the author upon request on appropriate letterhead In addition the book also can be seen as a comprehensive account of the particular transformational methodology developed within the Munich CIP project **Catalog of Copyright Entries.
