Corporate Environmental Management 1 Richard Welford, 2014-04-23 Presents a comprehensive analysis of the role of business in safeguarding the environment. It introduces the general issues and context and then gives a detailed critical examination of all the key tools of corporate environmental management including environmental management systems and standards, environmental policies, guidelines and charters, environmental auditing, life cycle assessment, the measurement of environmental performance and environmental reporting. The book emphasises systems based environmental management and also considers how such an approach might be integrated within local authorities and small and medium sized companies. It then extends the systems approach to cover continuous environmental improvement, building a corporate environmental profile and moving towards sustainability. Written in a clear and informative style with checklists, explanatory notes and references for further reading, the book draws on the existing environmental strategies of a number of leading firms. Each chapter is written by contributors involved in ongoing research and consultancy in their specialist area. This is the most authoritative guide available to contemporary approaches to corporate environmental management. Its how to focus makes it essential reading not only for students and researchers but for managers faced with the challenge of introducing environmental management strategies into their own organizations.

RICHARD WELFORD is Professor of Corporate Environmental Management and Director of the Centre for Corporate Environmental Management at the University of Huddersfield. He is also Professor of Sustainable Management at the Norwegian School of Management and a Director of ERP Environment. He is co-author of *The Earthscan Reader in Business and the Environment* (1996), author of *Corporate Environmental Management 2* (1997) and *Hijacking Environmentalism* (1997) and editor of the journal *Business Strategy and the Environment*. Best Practice Guide on Sampling and Monitoring of Metals in Drinking Water Adam Postawa, 2012-01-15 Part of *Metals and Related Substances in Drinking Water* Set. Buy all five books together to save over 30%. There is increasing concern regarding the presence of metals, particularly heavy metals, in drinking water. In addition to the well known toxic effects of lead, which are discussed at length in the *Best Practice Guide on the Control of Lead in Drinking Water* in this series of Guides, the latest WHO guide values for maximum mean concentrations of arsenic, nickel and others in drinking water have been lowered compared to previous versions. European Union, USA and National standards for drinking water have followed the trend based largely on the same toxicological information. There is currently growing interest in the presence of hexavalent chromium in drinking water following its finding in some drinking waters in the USA above the national upper limit for total chromium and research suggesting that this limit needs to be considerably lowered. Some metals, particularly iron and manganese, are associated with the production of discoloured, dirty water in distribution systems and are therefore very important to the production of water with acceptable aesthetic qualities. Others, iron and aluminium, are key to the treatment of raw waters to drinking water standards. In most cases it is not possible to continuously monitor waters for metals and suitable sampling programmes must be

designed and carried out to give results representative of the true water quality The Best Practice Guide on Sampling and Monitoring of Metals in Drinking Water gives guidance on the design and quality control of sampling programmes for metals in Raw waters in the water treatment works in the drinking water distribution system and at the consumers tap It also gives guidance on the analytical methods that can be used for the analysis of metals and quality control of those methods Sampling programmes on the same water will vary according to the purpose for which they are carried out and the statistical techniques used to determine and design the different types of programme are outlined Finally some case studies of optimisation of sampling are set out Best Practice Guide on Sampling and Monitoring of Metals in Drinking Water is a valuable text for scientists engineers and quality managers working in drinking water supply laboratory managers and scientists who carry out sampling and analysis and water industry consultants It is also an excellent resource for post graduate and research workers in the field of drinking water Editor Dr Adam Postawa AGH University Krakow Poland
