embarks on a comprehensive metaphysical exploration of how we should understand and study technological objects and systems. It reconstructs the metaphysics of technology and offers a unique perspective on the identification and functional classification of objects. Arguing that universal and static approaches are ill suited to capture relational properties like usefulness, the book introduces a novel approach called activity realism which recognises the dynamic identities that objects acquire by playing roles in different activities. How can the role and impact of technologies on human activities be incorporated into the metaphysical study of technologies? How do technologies affect the reality of scientifically postulated entities? How can we functionally distinguish between different types of technologies? **Problem Solving Technologies: A User Friendly Philosophy** engages with such fundamental questions. In this thought provoking book, the study of objects and their categorisations is paired with an examination of the activities in which they play a role. The result is a practically useful philosophy that helps to navigate the conceptual complexities of modern technology.
