Secondary Plant Succession In Tropical:

Ecological Succession on Fallowed Shifting Cultivation Fields Claudio O. Delang, Wing Man Li, 2012-12-20 The book reviews the literature on the ecological succession of plants on fallowed swiddens in tropical forests Patterns of ecological succession in tropical forests are insufficiently understood partly because results are scattered through a large number of case studies reported in academic articles So far no publication has attempted to bring these different case studies together to identify common patterns and trends The goal of the book is to review the different case studies and identify common patterns of ecological succession in fallowed swiddens as well as to pinpoint the factors that cause ecological succession in some areas to differ from those in other areas The book is organised in four different sections forest structure forest diversity species composition and the factors that contribute to differences in forest recovery rates the number of times the field was burned the length of fallow period the type of soil and the type of forest This book is an important contribution to tropical forestry and shifting cultivation Deforestation and forest degradation are the largest sources of CO₂ and shifting cultivation is one of the main culprits For this and other economic and political reason governments attempt to curtail shifting cultivation by shortening the years the fields can be left fallow or outright outlawing the farming practice Yet there is insufficient understanding of the processes of ecological succession in fallows which raises the questions as to whether the policy fulfils its objectives

Plant Succession D.C. Glenn-Lewin, R.K. Peet, T.T. Veblen, 1992-11-30 Succession is the term used to describe the phenomenon of changes in vegetational types in both time and space The subject of the colonization and exploitation of new areas by plants is a key one in ecology and this book summarizes the theoretical arguments currently raging about the topic

Vegetation Dynamics J. Miles, 2012-12-06 Vegetation dynamics is an important subject A knowledge and understanding of it is central to the science of vegetation management in grassland range and nature reserve management and in aspects of wildlife management forestry and agricultural crop production It is also a large and diffuse subject In a small book such as this I had to be highly selective and could not do equal justice to all aspects I have had therefore to condense many examples and more regrettably many arguments While I have tried to present a broad selection of topics and examples the content inevitably reflects my own special interests and experience The study of vegetation and its dynamics does not lend itself to neat and tidy divisions and the way of allotting material into different chapters here is arbitrary I have used Chapter I to introduce a number of ideas beginning with the nature of vegetation in space then passing to an introduction to the nature of changes in vegetation with time in particular those generally known as successions The book also contains a number of asides to the text's central arguments I hope the reader finds these interesting rather than disconcerting
