V. Narlikar, 2014-04 Unusual and unconventional features of a large variety of novel superconductors are presented and their technological potential as practical superconductors assessed *Advances in High Temperature Superconductors and their applications* S. MOHAN, 2019-06-20 Prof Heike Kamerlingh Onnes discovered superconductivity while measuring resistivity of mercury Surprisingly the resistivity of mercury ceased at 4.2 K and this phenomenon was known as superconductivity He realized the importance of this discovery in producing large magnetic fields It was realized that superconductivity is in a new thermodynamic state with peculiar electric and magnetic properties This paved the way to discover more superconductors Simple elements such as Tin Indium or lead showed the highest critical temperature T_c 7.2 K They were called as Type I superconductors Niobium nitride was found to superconduct at 16 K at 1941 and Vanadium silicon showed superconductive properties at 17.5 K at 1953 Nb alloys and binary or more complex compounds such as Nb₃Sn T_c 18 K Nb Ti T_c 9 K Ga V with T_c 23 K became type II superconductors Thereafter there was not much improvement in the development of superconductor although wonderful applications were expected from superconductors After three decades Fullerenes like ceramic superconductors are discovered A decade ago MgB₂ was discovered with T_c 39 K These superconductors were routinely produced into form of wires for producing larger magnetic fields In all these cases cooling was effectively done by liquid Helium A comprehensive microscopic theory of superconductivity in metals was proposed in 1957 by John Bardeen Leon Cooper and Robert Schrieffer the so called BCS theory for which they received the Nobel Prize in Physics In a major breakthrough George Bednorz and Karl Mueller discovered a brittle ceramic superconductivity in the family of cuprates at 30 K in 1986 and a new era began Inspired by the work of Bednorz and Mueller on high temperature superconductivity HTS Paul Chu and his associates at the University of Houston discovered in 1987 123 compounds That is YBCO Yttrium¹ Barium² Copper³ Oxygen⁷ and iso structural RBCO Rare earth¹ Barium² Copper³ Oxygen⁷ have a T_c of 93 K Prior to 1987 all superconducting materials had

lower critical temperatures T_c s and therefore functioned only at temperatures near the boiling point of liquid helium 4.2 K or liquid hydrogen 20.28 K with the highest being Nb₃Ge at 23 K. They were known as low temperature superconductors. YBCO was the first material to become superconducting above 77 K boiling point of liquid nitrogen and subsequently a series of high temperature superconducting materials were discovered. These superconducting materials are widely known as High temperature superconductors as these T_c s exceeded the limit prescribed by BCS theory. HTSCs are potentially valuable as liquid nitrogen is cheaper than liquid helium. YBCO possesses superior superconducting and physical properties. YBCO receiver coils in NMR spectrometers have improved the resolution NMR spectrometers by a factor of 3 compared to that achievable with conventional coils. Paul Chu's group holds the current T_c record of 164 K in the mercury barium based cuprate superconductor under pressure. Their work led to a rapid succession of new high temperature superconducting materials ushering in a new era in material science chemistry and technology. Added to this the structure of Bi₂Sr₂Ca₂Cu₂O₁₀ BiSCCO high temperature superconductive compound having T_c 110 K was reported. In 1993 mercuric cuprates perovskite ceramic superconductors with the transition temperatures T_c 138 K was also reported.

This book provides readers with a comprehensive overview of the science of superconducting materials. It serves as a fundamental information source on the actual techniques and methodologies involved in superconducting materials growth, characterization and processing. This book includes coverage of several categories of medium and high temperature superconducting materials: cuprate oxides, borides and iron based chalcogenides and pnictides. Provides a single source reference on superconducting materials growth, characterization and processing. Bridges the gap between materials science and applications of superconductors. Discusses several categories of superconducting materials such as cuprate oxides, borides and iron based chalcogenides and pnictides. Covers synthesis, characterization and processing of superconducting materials as well as the nanoengineering approach to tailor the properties of the used materials at the nanoscale level.

High-Temperature Superconductors Rainer Wesche, 2024-08-15. This book describes the status of research and development in the field of high temperature superconductivity reached in the mid of the twenty twenties. Starting from the milestones in the history of superconductivity, the main characteristics of the superconducting state are presented. Special physical properties of high temperature superconductors are highlighted. Main classes of superconducting materials are introduced with the focus on high temperature superconductors: cuprates and iron based superconductors and MgB₂. Besides the material properties relevant for applications, the deposition of superconductor films and the manufacture of high temperature superconductor wires are described. An outlook toward the future is included covering potential applications of high temperature superconductors in magnet technology and the electric power system.
