creation adoption and implementation of AISs As humans become entangled in sociotechnical systems defined by human and artificial agents there is a pressing need to understand how trust is created used and abused Compounding the difficulty in answering these questions stakeholders directly or indirectly affected by these systems differ in their motivations understanding and values This volume provides a comprehensive resource to help stakeholders understand ethical issues of designing and implementing AISs using an ethical sensemaking approach Starting with the general technical affordances of AIS Dr Jordan Richard Schoenherr considers the features of system design relating data integrity selection and interpretation of algorithms and the evolution processes that drive AISs innovation as a sociotechnological system The poles of technophobia algorithmic aversion and technophilia algorithmic preference in the public perception of AISs are then described and considered against existing evidence including issues ranging from the displacement and re education needs of the human workforce the impact of use of technology on interpersonal accord and surveillance and cybersecurity Ethical frameworks that provide tools for evaluating the values and outcomes of AISs are then reviewed and how they can be aligned with ethical sensemaking processes identified by psychological science is explored Finally these disparate threads are brought together in a design framework Also including sections on policies and guideline gaming and social media and Eastern philosophical frameworks this is fascinating reading for students and academics in psychology computer science philosophy and related areas as well as professionals such as policy makers and those working with AI systems

Cultures of Infancy Heidi Keller, 2022-05-26 The Classic Edition of Heidi Keller's *Cultures of Infancy* first published in 2007 includes a new introduction by the author which describes for readers the original context of her work how she has further developed her research and thinking and the ongoing relevance of this volume in the context of future challenges for the field In its original volume *Cultures of Infancy* presented the first systematic analysis of culturally informed developmental pathways synthesizing evolutionary and cultural psychological perspectives for a broader understanding of human development In this compelling book Heidi Keller utilizes ethnographic reports as well as quantitative and qualitative analyses to illustrate how humans resolve universal developmental tasks in particular sociodemographic contexts These contexts are represented in cultural models with three distinct models addressed throughout the text the model of independence with autonomy as developmental organizer the model of interdependence with relatedness as the developmental organizer and the model of autonomous relatedness representing particular mixtures of autonomy and relatedness The book offers an empirical examination of the first integrative developmental task during the early months of life relationship formation Keller shows that early parenting experiences shape the basic foundation of the self within particular models of parenting that are influenced by culturally informed socialization goals With distinct patterns of results that the studies have revealed *Cultures of Infancy* helps redefine developmental psychology as part of a culturally informed science based on evolutionary groundwork Scholars interested in a broad perspective on human development and culture will benefit from this pioneering

volume **Bio A.I. - From Embodied Cognition to Enactive Robotics** Adam Safron, Inês Hipólito, Andy Clark, 2023-12-08

Even before the deep learning revolution the landscape of artificial intelligence AI was already changing drastically in the 90s Embodied intelligence it was proposed must play a crucial role in the design of intelligent machines This new wave was inspired by what is today known as Embodied and Enactive Cognitive Science or E Cognition which considers that cognitive activity does not reduce to the intellectual capacities of agents being able to represent their environments E cognition set AI and robotics in a new direction in which intelligent machines are required to interact with the environment and where this interaction does not reduce to explicit representations or prespecified algorithms These ideas revolutionized the way we think about intelligent machines and cognition but these theoretical advances are only partially reflected in modern approaches to AI and machine learning ML Despite deeply impressive achievements AI ML still struggles to recapitulate the kinds of intelligence we find in natural systems whether we are considering individual insects e g simultaneous localization and mapping or swarm behaviour e g foraging sensing and ensemble inferences and especially the kinds of flexibility and high level reasoning characteristic of human cognition
