## **Models For Discrete Longitudinal Data:**

Models for Discrete Longitudinal Data Geert Molenberghs, Geert Verbeke, 2006-08-30 The linear mixed model has become the main parametric tool for the analysis of continuous longitudinal data as the authors discussed in their 2000 book Without putting too much emphasis on software the book shows how the different approaches can be implemented within the SAS software package The authors received the American Statistical Association's Excellence in Continuing Education Award based on short courses on longitudinal and incomplete data at the Joint Statistical Meetings of 2002 and 2004

**Models for Discrete Longitudinal Data** Geert Molenberghs, 2005      *Longitudinal Data Analysis* Garrett Fitzmaurice, Marie Davidian, Geert Verbeke, Geert Molenberghs, 2008-08-11 Although many books currently available describe statistical models and methods for analyzing longitudinal data they do not highlight connections between various research threads in the statistical literature Responding to this void Longitudinal Data Analysis provides a clear comprehensive and unified overview of state of the art theory

*Modeling Longitudinal Data* Robert E. Weiss, 2006-12-06 Longitudinal data are ubiquitous across Medicine Public Health Public Policy Psychology Political Science Biology Sociology and Education yet many longitudinal data sets remain improperly analyzed This book teaches the art and statistical science of modern longitudinal data analysis The author emphasizes specifying understanding and interpreting longitudinal data models He inspects the longitudinal data graphically analyzes the time trend and covariates models the covariance matrix and then draws conclusions Covariance models covered include random effects autoregressive autoregressive moving average antedependence factor analytic and completely unstructured models among others Longer expositions explore an introduction to and critique of simple non longitudinal analyses of longitudinal data missing data concepts diagnostics and simultaneous modeling of two longitudinal variables Applications and issues for random effects models cover estimation shrinkage clustered data models for binary and count data and residuals and residual plots Shorter sections include a general discussion of how computational algorithms work handling transformed data and basic design issues This book requires a solid regression course as background and is particularly intended for the final year of a Biostatistics or Statistics Masters degree curriculum The mathematical prerequisite is generally low mainly assuming familiarity with regression analysis in matrix form Doctoral students in Biostatistics or Statistics applied researchers and quantitative doctoral students in disciplines such as Medicine Public Health Public Policy Psychology Political Science Biology Sociology and Education will find this book invaluable The book has many figures and tables illustrating longitudinal data and numerous homework problems The associated web site contains many longitudinal data sets examples of computer code and labs to re enforce the material From the reviews This book is extremely well presented and it has been written in a style that makes its reading really pleasant and enjoyable I highly recommend Modeling Longitudinal Data as a good reference book for anyone interested in looking into the art and statistical science of modern longitudinal data analysis Journal of Applied Statistics December 2005 The book is clearly written and well

presented The author's accumulated experience in presenting the material comes over On balance this is one of the books which anyone about to teach a practical course in longitudinal data analysis should consider adopting as the course text

Short Book Reviews of the ISI June 2006 Modeling Longitudinal Data is a welcome addition to the vast literature on longitudinal data analysis The book requires little in terms of prerequisites but offers a great deal Zhigang Zhang for the Journal of the American Statistical Association December 2006 Overall Robert Weiss's book can be used as an excellent textbook for a first master level course in longitudinal data analysis in a statistics or biostatistics program or as a self study book for applied researchers interested in this area The style is very clear concepts are explained in an engaging way and amply illustrated and the chapters on covariate selection and modeling the variance covariance matrix are definite assets

Ralitza Gueorgueiva for Biostatistics September 2006 *Dynamic Mixed Models for Familial Longitudinal Data* Brajendra C. Sutradhar, 2011-01-27 This book provides a theoretical foundation for the analysis of discrete data such as count and binary data in the longitudinal setup Unlike the existing books this book uses a class of auto correlation structures to model the longitudinal correlations for the repeated discrete data that accommodates all possible Gaussian type auto correlation models as special cases including the equi correlation models This new dynamic modelling approach is utilized to develop theoretically sound inference techniques such as the generalized quasi likelihood GQL technique for consistent and efficient estimation of the underlying regression effects involved in the model whereas the existing working correlations based GEE generalized estimating equations approach has serious theoretical limitations both for consistent and efficient estimation and the existing random effects based correlations approach is not suitable to model the longitudinal correlations The book has exploited the random effects carefully only to model the correlations of the familial data Subsequently this book has modelled the correlations of the longitudinal data collected from the members of a large number of independent families by using the class of auto correlation structures conditional on the random effects The book also provides models and inferences for discrete longitudinal data in the adaptive clinical trial set up The book is mathematically rigorous and provides details for the development of estimation approaches under selected familial and longitudinal models Further while the book provides special cares for mathematics behind the correlation models it also presents the illustrations of the statistical analysis of various real life data This book will be of interest to the researchers including graduate students in biostatistics and econometrics among other applied statistics research areas Brajendra Sutradhar is a University Research Professor at Memorial University in St John's Canada He is an elected member of the International Statistical Institute and a fellow of the American Statistical Association He has published about 110 papers in statistics journals in the area of multivariate analysis time series analysis including forecasting sampling survival analysis for correlated failure times robust inferences in generalized linear mixed models with outliers and generalized linear longitudinal mixed models with bio statistical and econometric applications He has served as an associate editor for six years for Canadian Journal of Statistics and for four

years for the Journal of Environmental and Ecological Statistics He has served for 3 years as a member of the advisory committee on statistical methods in Statistics Canada Professor Sutradhar was awarded 2007 distinguished service award of Statistics Society of Canada for his many years of services to the society including his special services for society's annual meetings *Bayesian Semiparametric Models for Discrete Longitudinal Data* Sylvie Tchumtchoua, 2010

**Antedependence Models for Longitudinal Data** Dale L. Zimmerman, Vicente A. Núñez-Antón, 2009-08-19 The First Book Dedicated to This Class of Longitudinal Models Although antedependence models are particularly useful for modeling longitudinal data that exhibit serial correlation few books adequately cover these models By gathering results scattered throughout the literature Antedependence Models for Longitudinal Data offers a convenient systematic way to learn about antedependence models Illustrated with numerous examples the book also covers some important statistical inference procedures associated with these models After describing unstructured and structured antedependence models and their properties the authors discuss informal model identification via simple summary statistics and graphical methods They then present formal likelihood based procedures for normal antedependence models including maximum likelihood and residual maximum likelihood estimation of parameters as well as likelihood ratio tests and penalized likelihood model selection criteria for the model's covariance structure and mean structure The authors also compare the performance of antedependence models to other models commonly used for longitudinal data With this book readers no longer have to search across widely scattered journal articles on the subject The book provides a thorough treatment of the properties and statistical inference procedures of various antedependence models **Applied Longitudinal Analysis** Garrett M.
