Starting Science...Again? Martin Braund, 2008-10-09 The structure of this book encourages active participation via reflective activity boxes which further allows for the engagement and consolidation of ideas Evidence based research is cited resulting in the author suggesting a number of practical activities to encourage progression and continuity in science ESCalate Why do pupils learning and motivation slow down markedly as they move from primary to secondary school Why is this situation worse in science than in any other curriculum subject This book combines reports of and reflection on best practice in improving progression and continuity of teaching and learning in science particularly at that transition stage between primary and secondary school Presenting the views of teachers and pupils on progression learning and application of science the book suggests practical ways of improving teaching and learning in science Each chapter includes examples of learning materials with notes on how these might be used or adapted by teachers in their own classroom settings Science teaching in secondary schools is often based on assumptions that children know or can do very little so the job in the secondary school becomes one of showing pupils how to start doing science properly as if from scratch The damage that this false view can do to pupils learning motivation and confidence is clear This book will help teachers to assess children s prior knowledge effectively and build meaningful and enjoyable science lessons

Creating Connections David Chittenden, Graham Farmelo, Bruce V. Lewenstein, 2004-05-17 Science museums are in the business of making science accessible to the public a public constantly bombarded with new information and research results How the public understands this information will affect what they expect and take away from a museum s exhibits and programs Creating Connections looks at the public understanding of research PUR and how it affects what science museums do What are the opportunities and critical issues in PUR What strategies are working and what are some

pitfalls What can be learned from the media's experiences with PUR Creating Connections will be an invaluable resource for science museum professionals who want to guide their institutions and their visitors toward a new understanding of and appreciation for current research

A Philosopher Looks at Science Nancy Cartwright, 2022-06-30 What is science and what can it do Nancy Cartwright here takes issue with three common images of science that it amounts to the combination of theory and experiment that all science is basically reducible to physics and that science and the natural world which it pictures are deterministic The author's innovative and thoughtful book draws on examples from the physical life and social sciences alike and focuses on all the products of science not just experiments or theories and how they work together She reveals just what it is that makes science ultimately reliable and how this reliability is nevertheless still compatible with a view of nature as more responsive to human change than we might think Her book is a call for greater intellectual humility by and within scientific institutions It will have strong appeal to anyone who thinks about science and how it is practised in society

Karl Popper, Science and

Enlightenment Nicholas Maxwell, 2017-09-26 Here is an idea that just might save the world It is that science properly understood provides us with the methodological key to the salvation of humanity A version of this idea can be found in the works of Karl Popper Famously Popper argued that science cannot verify theories but can only refute them and this is how science makes progress Scientists are forced to think up something better and it is this according to Popper that drives science forward But Nicholas Maxwell finds a flaw in this line of argument Physicists only ever accept theories that are unified theories that depict the same laws applying to the range of phenomena to which the theory applies even though many other empirically more successful disunified theories are always available This means that science makes a questionable assumption about the universe namely that all disunified theories are false Without some such presupposition as this the whole empirical method of science breaks down By proposing a new conception of scientific methodology which can be applied to all worthwhile human endeavours with problematic aims Maxwell argues for a revolution in academic inquiry to help humanity make progress towards a better more civilized and enlightened world

Investigating Complex

Phenomena: Bridging between Systems Thinking and Modeling in Science Education Tom Bielik, Moritz Krell, Laura Zangori, Orit Ben Zvi Assaraf, 2023-11-15 Understanding the complexity of the natural world and making sense of phenomena is one of the main goals of science and science education When investigating complex phenomena such as climate change or pandemic outbreaks students are expected to engage in systems thinking by considering the boundaries of the investigated system identifying the relevant components and their interactions and exploring system attributes such as hierarchical organization dynamicity feedback loops and emergence Scientific models are tools that support students reasoning and understanding of complex systems and students are expected to develop their modeling competence and to engage in the

modeling process by constructing testing revising and using models to explain and predict phenomena Computational modeling tools for example provide students with the opportunity to explore big data run simulations and investigate complex systems Therefore both systems thinking and modeling approaches are important for science education when investigating complex phenomena
