Remote Sensing and Geographical Information Systems in Epidemiology S.I. Hay, David James Rogers, Sarah E. Randolph, 2000-08-29 Global problems require global information which satellites can now provide With ever more sophisticated control methods being developed for infectious diseases our ability to map spatial and temporal variation in risk is more important than ever Only then may we plan control campaigns and deliver novel interventions and remedies where the need is greatest and sustainable success is most likely This book presents a comprehensive guide to using the very latest methods of surveillance from satellites including analysing spatial data within geographical information systems interpreting complex biological patterns and predicting risk both today and as it may change in the future Of all infectious disease systems those that involve free living invertebrate vectors or intermediate hosts are most susceptible to changing environmental conditions and have hitherto received most attention from the marriage of analytical biology with this new space technology Accordingly this volume presents detailed case studies on malaria African trypanosomiasis sleeping sickness tick borne infections and helminths worms For those who are unfamiliar with this science and unsure how to start the book ends with a chapter of practical advice on where to seek hands on instruction The lessons to be learned from these studies are applicable to many other epidemiological and ecological problems that face us today most significantly the preservation of the world s biodiversity Only book to provide a synthesis of complex biology quantitative analysis space technology and practical applications focused on solving real epidemiological problems on a global scale Broad scope with methods relevant to subjects ranging from biodiversity to public health Practical advice on relevant courses 24 pages of colour plates *Spatial Analysis, GIS and Remote Sensing* Donald P. Albert, Wilbert M. Geospatial Technologies in Environmental Management Nancy Hoalst-Pullen, Mark W. Patterson, 2010-09-27

Geotechnologies and the Environment Environmental Applications and Management presents an engaging and diverse array of physically oriented GIScience applications that have been organized using four broad themes While the book's themes are by no means mutually exclusive Hoalst Pullen and Patterson provide an elegant overview of the field that frames the collection's subsequent thematic structure Wilderness and Wildlife Response Glaciers Wetlands and Watersheds and Human Health and the Environment Over the course of the volume the contributing authors move beyond basic and in some respects cliché landscape ecology of land use change to explore human environment dynamics heretofore not emphasized in the applied literature In doing so the collection presents a compelling case for the importance of developing new physically oriented GIScience applications that reside at the nexus of social and natural systems with the explicit intent of informing public policy and or the decision making practices of resource managers Individually the chapters themselves are intentionally diverse The diversity of the approaches their spatial context and emphases on management applications demonstrate the many ways in which geotechnologies can be used to address small and big problems in both developed and developing regions The collection's internal coherence is derived like the book series from its explicit appeal to a wide variety of human environment interactions with potential policy linkages      **Trematode Infections: Advances in Research and**
