Modelling Trig Functions

Model any repeating real phenomenon that can be modelled using periodic trigonometric functions. For example, use your knowledge of the tide to find height and volume of water.

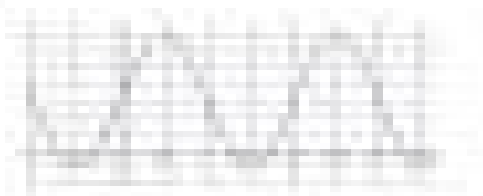

Example 1:

- (1) Write the equation of the wave function whose period is 24, amplitude is 3.

- (2) Write the equation of the wave function whose period is 2, amplitude of the wave is 2, and 4.

Example 2:

The graph is a standard cosine function.

Working tip:

- (1) To determine the equation that models a repeating phenomenon that has period $\frac{2\pi}{b}$ and the phase shift:
- (2) To determine the equation that models a repeating phenomenon that has amplitude a and the phase shift c :
- (3) Cross your hand from period phase to amplitude (multiplied) with the period. The answer will come the same as the negative sign of the horizontal axis and the phase shift.
- (4) The maximum and minimum values will have the same function (sine or cosine) and will have the same period and phase shift.
- (5) $\frac{2\pi}{b}$ from the period where the phase shift is 0 will give the maximum and minimum values.

Functions Modeling Change: A Preparation for Calculus, 6e Student Solutions Manual Eric Connally, Deborah Hughes-Hallett, Andrew M. Gleason, 2019-10-01 Functions Modeling Change 6th edition prepares students for Calculus by stressing conceptual understanding and the connections among mathematical ideas The authors emphasize depth of understanding rather than breadth of coverage Each function is presented symbolically numerically graphically and verbally the Rule of Four Students are encouraged to create mathematical models that relate to the world around them and are exposed to a large number of real world applications examples and problems

Design of Reconfigurable Antennas Using Graph Models Joseph Costantine, Youssef Tawk, Christos Christodoulou, 2022-06-01 This lecture discusses the use of graph models to represent reconfigurable antennas The rise of antennas that adapt to their environment and change their operation based on the user's request hasn't been met with clear design guidelines There is a need to propose some rules for the optimization of any reconfigurable antenna design and performance Since reconfigurable antennas are seen as a collection of self-organizing parts graph models can be introduced to relate each possible topology to a corresponding electromagnetic performance in terms of achieving a characteristic frequency of operation impedance and polarization These models help designers understand reconfigurable antenna structures and enhance their functionality since they transform antennas from bulky devices into mathematical and software accessible models The use of graphs facilitates the software control and cognition ability of reconfigurable antennas while optimizing their performance This lecture also discusses the reduction of redundancy complexity and reliability of reconfigurable antennas and reconfigurable antenna arrays The full analysis of these parameters allows a better reconfigurable antenna implementation in wireless and space communications platforms The use of graph models to reduce the complexity while preserving the reliability of reconfigurable antennas allow a better incorporation in applications such as cognitive radio MIMO satellite communications and personal communication systems A swifter response time is achieved with less cost and losses This lecture is written for individuals who wish to venture into the field of reconfigurable antennas with a little prior experience in this area and learn how graph rules and theory mainly used in the field of computer science networking and control systems can be applied to electromagnetic structures This lecture will walk the reader through a design and analysis process of reconfigurable antennas using graph models with a practical and theoretical outlook
