Modelling Forest Development:

Modelling Forest Development Klaus von Gadow, Gangying Hui, 2001-11-30 The key to successful timber management is a proper understanding of growth processes and one of the objectives of modelling forest development is to provide the tools that enable foresters to compare alternative silvicultural treatments In a managed woodland the most important periodic disturbances are the thinning operations which are often carried out at regular intervals and which usually have a significant effect on the future evolution of the resource Thus a realistic model of forest development includes both natural growth and thinnings One of the outstanding features of this book is its inclusion of thinning models at varying levels of resolution and consideration of differences in foresters tree marking behaviour Other interesting aspects include regional resource forecasting approaches generalized stem taper functions generalized diameter height relations new ways of describing and reproducing forest spatial structures crown modelling and iterative competition modelling Worked examples and code are provided where appropriate The intended readership is graduate students

Modelling Forest Development Klaus von Gadow, Gangying Hui, 2013-12-01 In an unmanaged woodland forest development follows a succession of periods of undisturbed natural growth interrupted by intermediate loss or damage of trees caused by fire or wind or other natural hazards In a managed woodland the most important periodic disturbances are the thinning operations which are often carried out at regular intervals and which usually have a significant effect on the future evolution of the resource Thus a realistic model of forest development includes both natural growth and thinnings The key to successful timber management is a proper understanding of growth processes and one of the objectives of modelling forest development is to provide the tools that enable foresters to compare alternative silvicultural treatments Foresters need to be able to anticipate the consequences of a particular thinning operation In most cases total timber volume is not a very appropriate measure for quantifying growth or yields or changes caused by thinning operations Yield in economic terms is defined by the dimensions and quality attributes of the harvestable logs and estimating timber products is a central issue of production oriented growth and yield research Introduction 2 Growth modelling is also an essential prerequisite for evaluating the consequences of a particular management action on the future development of an important natural resource such as a woodland ecosystem
