Nonlinear Dynamics In Solids:

Nonlinear Dynamics in Solids Harry Thomas, 2012-12-06 This volume contains the notes of lectures given at the school on Nonlinear Dynamics in Solids held at the Physikzentrum Bad Honnef 2-6 October 1989 under the patronage of the Deutsche Physikalische Gesellschaft Nonlinear dynamics has become a highly active research area owing to many interesting developments during the last three decades in the theoretical analysis of dynamical processes in both Hamiltonian and dissipative systems Research has been focused on a variety of problems such as the characteristics of regular and chaotic motion in Hamiltonian dynamics the problem of quantum chaos the formation and properties of solitary spatio-temporal structures the occurrence of strange attractors in dissipative systems and the bifurcation scenarios leading to complex time behaviour Until recently predictions of the theory have been tested predominantly on instabilities in hydrodynamic systems where many interesting experiments have provided valuable input and have led to a fruitful interaction between experiment and theory Fluid systems are certainly good candidates for performing clean experiments free from disturbing influences with fluids compared to solids it is simpler to prepare good samples the relevant length and time scales are in easily accessible ranges and it is possible to do measurements inside the fluid because it can be filled in after the construction of the apparatus Further the theory describing the macroscopic dynamics of fluids is well established and contains only very few parameters all of which have well known values

Nonlinear Dynamics in Solids Dr Harry Thomas, 1992-05-25 This is the second volume in a sequence of books covering especially interesting and ambitious schools of the German Physical Society held at the Physics Center Bad Honnef It presents the current state of research on nonlinear dynamics in solids Up to now almost all experimental results on nonlinear dynamics of spatio-temporal phenomena come from hydrodynamic systems These reviews focus on nonlinear dynamical phenomena in semiconductors nonlinear optical systems ferromagnetic systems and spatially chaotic structures in solids All are written at a level that makes them accessible to students with an undergraduate education in physics or mathematics

Universality of Nonclassical Nonlinearity Pier Paolo Delsanto, 2006-12-13

Variety is perhaps the most amazing attribute of Nature with an almost endless array of different molecules and aggregates and tens of millions of distinct forms of life Yet in spite of this bewildering diversity there are some common patterns henceforth called phenomenological universalities that are found over and over again in completely different contexts A quest for universalities is not only interesting per se but can also yield practical applications If several fields share a common mathematical or conceptual background a cross-fertilization among them may lead to quick progress even if ultimately the specific details of any individual application must be considered independently We all know that we live in a nonlinear world although scientists have often tried to linearize it sometimes as a first step towards understanding its complexity often because before the advent of ubiquitous high computational power a linear approximation was the only viable alternative In this book we use the term

nonclassical nonlinearity with reference to a particularly intriguing kind of phenomenology which has been extensively investigated in the fields of elasticity and materials and whose universality has been conjectured. Its signatures are hysteresis, discrete memory and other effects which in the case of continuum mechanics have been called fast and slow dynamics.
