Real Time Object Oriented Modeling:

Real-Time Object-Oriented Modeling Bran Selic, Garth Gullekson, Paul T. Ward, 1994-05-06 Are you looking for a more effective approach to real time systems development Real Time Object Oriented Modeling The development of real time distributed systems is one of the most difficult engineering problems ever faced taxing the capabilities of traditional real time software development approaches Real Time Object Oriented Modeling is the first book that brings together in a single harmonious approach the power of object oriented concepts tailored specifically for real time systems with an iterative and incremental process based on the use of executable models Developed by practitioners the proven methodology described here is becoming a leader in the industry Using a learn by example approach this book offers A single consistent set of graphical modeling concepts chosen to improve developer effectiveness which apply uniformly to analysis design and implementation This reduces the learning curve to master the entire method and eliminates expensive discontinuities across different stages of development An approach to the object paradigm that is easy to learn and that applies to the construction of reusable architectural design components not just low level language elements This unleashes the true power of the object paradigm Techniques for constructing executable models to gain early confidence in specifications and design decisions Approaches to project management that deliver the benefits of the object paradigm and executable models Advanced Concepts, Life Cycle Models and Tools for Object-oriented Software Development, 1997 Model-Based Engineering of Embedded Real-Time Systems Holger Giese, Gabor Karsai, Edward A. Lee, Bernhard Rumpe, Bernhard Schätz, 2010-10-06 The topic of Model Based Engineering of Real Time Embedded Systems brings together a challenging problem domain real time embedded systems and a solution domain model based engineering It is also at the forefront of integrated software and systems engineering as software in this problem domain is an essential tool for system implementation and integration Today real time embedded software plays a crucial role in most advanced technical systems such as airplanes mobile phones and cars and has become the main driver and catalyst for innovation Development evolution verification configuration and maintenance of embedded and distributed software nowadays are often serious challenges as drastic increases in complexity can be observed in practice Model based engineering in general and model based software development in particular advocates the notion of using models throughout the development and life cycle of an engineered system Model based software engineering reinforces this notion by promoting models not only as the tool of abstraction but also as the tool for verification implementation testing and maintenance The application of such model based engineering techniques to embedded real time systems appears to be a good candidate to tackle some of the problems arising in the problem domain *Real-Time Software Design for Embedded Systems* Hassan Gomaa, 2016-05-26 This tutorial reference takes the reader from use cases to complete architectures for real time embedded systems using SysML UML and MARTE and shows how to apply the COMET RTE design method to real world problems The author covers key topics such as architectural patterns for distributed and

hierarchical real time control and other real time software architectures performance analysis of real time designs using real time scheduling and timing analysis on single and multiple processor systems Complete case studies illustrating design issues include a light rail control system a microwave oven control system and an automated highway toll system Organized as an introduction followed by several self contained chapters the book is perfect for experienced software engineers wanting a quick reference at each stage of the analysis design and development of large scale real time embedded systems as well as for advanced undergraduate or graduate courses in software engineering computer engineering and software design

Shafer,2012-12-06

Masters Theses in the Pure and Applied Sciences was first conceived published and disseminated by the Center for Information and Numerical Data Analysis and Synthesis CINDAS at Purdue University in 1957 starting its coverage of theses with the academic year 1955 Beginning with Volume 13 the printing and dissemination phases of the activity were transferred to University Microfilms Xerox of Ann Arbor Michigan with the thought that such an arrangement would be more beneficial to the academic and general scientific and technical community After five years of this joint undertaking we had concluded that it was in the interest of all concerned if the printing and distribution of the volumes were handled by an international publishing house to assure improved service and broader dissemination Hence starting with Volume 18 Masters Theses in the Pure and Applied Sciences has been disseminated on a worldwide basis by Plenum Publishing Corporation of

New York and in the same year the coverage was broadened to include Canadian universities All back issues can also be ordered from Plenum We have reported in Volume 38 thesis year 1993 a total of 13 787 thesis titles from 22 Canadian and 164 United States universities We are sure that this broader base for these titles reported will greatly enhance the value of this important annual reference work While Volume 38 reports theses submitted in 1993 on occasion certain universities do report theses submitted in previous years but not reported at the time

Model-Driven Development of Reliable Automotive Services Manfred Broy, Ingolf Krüger, Michael Meisinger, 2008-07-17

Software development for the automotive domain has become the enabling technology for almost all safety critical and comfort functions offered to the customer. Ninety percent of all innovations in automotive systems are directly or indirectly enabled by embedded software. The numbers of serious accidents have declined in recent years despite constantly increasing traffic; this is correlated with the introduction of advanced software-enabled functionality for driver assistance such as electronic stability control. Software contributes significantly to the automotive value chain. By 2010 it is estimated that software will make up 40% of the value creation of automotive electronics. However, with the large number of software-enabled functions, their interactions and the corresponding networking and operating infrastructure come significant complexities both during the automotive systems engineering process and at runtime. A central challenge for automotive systems development is the scattering of functionality across multiple subsystems such as electronic control units (ECUs) and the associated networks. As an example, consider the central locking systems (CLS) whose functionality is spread out over up to 19 different ECUs in some luxury cars. Of course, this includes advanced functionality such as seat positioning and radio tuning according to driver presets upon entry as well as unlocking in case of a detected impact or accident. However, this example demonstrates that modern automotive systems bridge comfort and safety-critical functionality. This induces particular demands on safety and security and in general software and systems quality. The resulting challenges and opportunities were discussed in depth at the second Automotive Software Workshop San Diego (ASWSD 2006) on whose results we report here.
