Sedimentary Processes Quantification Using Radionuclides:

Sedimentary Processes: Quantification Using Radionuclides J. Carroll, I. Lerche, 2003-09-19 The advent of radionuclide methods in geochronology has revolutionized our understanding of modern sedimentary processes in aquatic systems This book examines the principles of the method and its use as a quantitative tool in marine geology with emphasis on the Pb 210 method The assumptions and consequences of models and their behaviour are described providing the necessary background to assess the advantages and trade offs involved when choosing a particular model for application One of the purposes of this volume is to disentangle the influences of complicating factors such as sediment flux variations post depositional diffusion of radionuclides and bio irrigation of sediments to arrive at sediment ages and to properly assess the attendant data uncertainty Environmental impacts of chemical nuclear or other waste material are of concern in a variety of areas around the world today A number of relevant examples are included demonstrating how dating models are useful for determining sources of contaminants and interpreting their influence on the environment The book is set at a level so that an able student or professional should have no difficulty in following the procedures and methods developed Each chapter includes case histories showing the strengths and weaknesses of a given procedure with respect to a data example Included with this volume is the computer source code of a new generation of modelling tools based on inverse numerical analysis techniques This first generation of the modelling tool is included along with detailed instructions and examples for its use in an appendix

Michael F. L'Annunziata, 2012-08-16 Authoritative reference providing the principles practical techniques and procedures for the accurate measurement of radioactivity *Marine Radioactivity*, 2004-09-17 This book on Marine Radioactivity sets out to cover most of the aspects of marine radioactivity which have been the focus of scientific study in recent decades The authors and their reviews divide into topic areas which have defined the field over its history They cover the suite of natural radioisotopes which have been present in the oceans since their formation and quantitatively dominate the inventory of radioactivity in the oceans Also addressed are the suite of artificial radionuclides introduced to the oceans as a consequence of the use of the atom for development of nuclear energy nuclear weapons and various applications of nuclear science The major source of these continues to derive from the global fallout of atmospheric tests of nuclear weapons in the 1950s and 1960s but also includes both planned and accidental releases of radioactivity from both civilian and military nuclear technology The other division of the major study direction depends on whether the objective is to use the radionuclides as powerful tools to study oceanic processes to describe and understand the ocean distribution of the various natural or artificial radionuclides or to assess the different radionuclides impact on and pathways to man or marine organisms The oceans cover 70% of the Earth's surface and thus contains a corresponding large share of the Earth's radioactivity Marine Radioactivity covers topics of recent scientific study in this young field It examines both natural radioactivity radioactivity naturally present in oceans since their formation and artificial radioactivity radioactivity introduced by man and use of atomic and nuclear energy with regard to possible effects on the global environment **Natural and artificial**

Tropical Radioecology J.R. Twining, 2012-12-31 *Tropical Radioecology* is a guide to the wide range of scientific practices and principles of this multidisciplinary field It brings together past and present studies in the tropical and sub tropical areas of the planet highlighting the unique aspects of tropical systems Until recently radioecological models for tropical environments have depended upon data derived from temperate environments despite the differences of these regions in terms of biota and abiotic conditions Since radioactivity can be used to trace environmental processes in

humans and other biota this book offers examples of studies in which radiotracers have been used to assess biokinetics in tropical biota Features chapters co authored by world experts that explain the origins inputs distribution behaviour and consequences of radioactivity in tropical and subtropical systems Provides comprehensive lists of relevant data and identifies current knowledge gaps to allow for targeted radioecological research in the future Integrates radioecological information into the most recent radiological consequences modelling and best practice probabilistic ecological risk analysis methodology given the need to understand the implications of enhanced socio economic development in the world s tropical regions

Sediments in the Tema Harbour (Ghana) Benjamin O. Botwe, 2018-07-11 Sediment pollution and accumulation in harbours are major environmental issues and studies that advance their solutions are essential for harbour sustainability This book provides the first comprehensive assessment of chemical pollution in sediments and sediment accumulation rates in the tropical Tema Harbour Ghana This book contributes to improving our ability to use an integrated approach involving sediment chemistry and bioassays in one comprehensive assessment of the contamination state of a tropical coastal environment Whole sediment toxicity bioassays using the amphipod *Corophium volutator* and the polychaete *Hediste diversicolor* as bioindicators were combined with data on concentrations of total metal and metal binding forms radionuclides organochlorine pesticides and polycyclic aromatic hydrocarbons in bottom sediments as well as total metal concentrations in settling silt clay particles collected by sediment traps to characterise the hazard risk and impact of sediments from the tropical coastal Tema Harbour

Freshwater and Estuarine Radioecology G. Desmet, 1997 Hardbound The Chernobyl accident drew attention to the difficulties of understanding the dynamics of radionuclide transport through the environment using older methods developed after the pseudo steady state pollution resulting after the weapons testing fallout More recent approaches which are reported in this book have incorporated both the dynamic aspects highlighted by the pulse Chernobyl input and the importance of improvement in models that can be brought about by constraining parameters on the basis of a knowledge of the fundamental physics chemistry biology and ecology of the ecosystems involved The papers within this volume include hydrodynamic models of suspended solids transport ion exchange interpretation of radionuclide sorption approaches applying a knowledge of membrane transport kinetics to the uptake of radionuclides by biota the effects of different ecological niches on the relative uptake of radionuclides by different species

Handbook for the Assessment of Soil Erosion and Sedimentation Using Environmental Radionuclides F. Zapata, 2007-05-08 This publication deals with soil erosion and sedimentation Soil erosion and associated sediment deposition are natural landscape forming processes that can be greatly accelerated by human intervention through deforestation overgrazing and non sustainable farming practices Soil erosion and sedimentation may not only cause on site degradation of the natural resource base but also off site problems downstream sediment deposition in fields floodplains and water bodies water pollution eutrophication and reservoir siltation etc with serious environmental and economic impairment There is an urgent need for accurate information to quantify the

problem and to underpin the selection of effective soil conservation technologies and sedimentation remediation strategies including assessment of environmental and economic impacts Existing classical techniques to document soil erosion are capable of meeting some of these needs but they all possess important limitations The quest for alternative techniques for assessing soil erosion to complement existing methods directed attention to the use of environmental radionuclides in particular fallout as tracers to quantify rates and establish patterns of soil redistribution within the landscape The concept of a project on the use of environmental radionuclides to quantify soil redistribution was first formulated at an Advisory Group Meeting convened in Vienna April 1993 by the International Atomic Energy Agency IAEA
