## **Loop Parallelization:**

**Loop Parallelization** Utpal Banerjee, 2013-06-29 Automatic transformation of a sequential program into a parallel form is a subject that presents a great intellectual challenge and promises a great practical award There is a tremendous investment in existing sequential programs and scientists and engineers continue to write their application programs in sequential languages primarily in Fortran The demand for higher speedups increases The job of a restructuring compiler is to discover the dependence structure and the characteristics of the given machine Much attention has been focused on the Fortran do loop This is where one expects to find major chunks of computation that need to be performed repeatedly for different values of the index variable Many loop transformations have been designed over the years and several of them can be found in any parallelizing compiler currently in use in industry or at a university research facility The book series on KappaLoop Transformations for Restructuring Compilers kappa provides a rigorous theory of loop transformations and dependence analysis We want to develop the transformations in a consistent mathematical framework using objects like directed graphs matrices and linear equations Then the algorithms that implement the transformations can be precisely described in terms of certain abstract mathematical algorithms The first volume Loop Transformations for Restructuring Compilers The Foundations provided the general mathematical background needed for loop transformations including those basic mathematical algorithms discussed data dependence and introduced the major transformations The current volume Loop Parallelization builds a detailed theory of iteration level loop transformations based on the material developed in the previous book *Automatic Parallelization* Samuel Midkiff, 2022-06-01 Compiling for parallelism is a longstanding topic of compiler research This book describes the fundamental principles of compiling regular numerical programs for parallelism We begin with an explanation of analyses that allow a compiler to understand the interaction of data reads and writes in different statements and loop iterations during program execution These analyses include dependence analysis use def analysis and pointer analysis Next we describe how the results of these analyses are used to enable transformations that make loops more amenable to parallelization and discuss transformations that expose parallelism to target shared memory multicore and vector processors We then discuss some problems that arise when parallelizing programs for execution on distributed memory machines Finally we conclude with an overview of solving Diophantine equations and suggestions for further readings in the topics of this book to enable the interested reader to delve deeper into the field Table of Contents Introduction and overview Dependence analysis dependence graphs and alias analysis Program parallelization Transformations to modify and eliminate dependences Transformation of iterative and recursive constructs Compiling for distributed memory machines Solving Diophantine equations A guide to further reading

**Symbolic Parallelization of Nested Loop Programs** Alexandru-Petru Tanase, Frank Hannig, Jürgen Teich, 2018-02-22 This book introduces new compilation techniques using the polyhedron model for the resource adaptive parallel execution of loop programs on

massively parallel processor arrays The authors show how to compute optimal symbolic assignments and parallel schedules of loop iterations at compile time for cases where the number of available cores becomes known only at runtime The compile runtime symbolic parallelization approach the authors describe reduces significantly the runtime overhead compared to dynamic or just in time compilation The new on demand fault tolerant loop processing approach described in this book protects loop nests for parallel execution against soft errors
