Significant advances in the performance and efficiency of jet and rocket propulsion systems are strongly dependent on the development of lighter, more durable, high temperature materials. Materials development has been significantly reduced in the United States since the early 1990s when the Department of Defense (DOD) the military services and industry had very active materials development activities to underpin the development of new propulsion systems. This resulted in significant improvements in all engine characteristics and established the United States in global propulsion technology. Many of the significant advances in aircraft and rocket propulsion have been enabled by improved materials and materials manufacturing processes. To improve efficiency further engine weight must be reduced while preserving thrust. **Materials Needs and Research and Development Strategy for Future Military Aerospace Propulsion Systems** examines whether current and planned U.S. efforts are sufficient to meet U.S. military needs while keeping the U.S. on the leading edge of propulsion technology. This report considers mechanisms for the timely insertion of materials in propulsion systems and how these mechanisms might be improved and describes the general elements of research and development strategies to develop materials for future military aerospace propulsion systems. The conclusions and recommendations asserted in this report will enhance the efficiency level of effort and impact of DOD materials development activities. **Architecting Robust Co-Design of Materials, Products, and Manufacturing Processes** Anand Balu Nellippallil, Janet K. Allen, B. P. Gautham, Amarendra K. Singh, Farrokh Mistree, 2020-06-13 This book explores systems based co design introducing a Decision Based Co Design (DBCD) approach for the co design of materials, products and processes. In recent years there have been significant advances in modeling and simulation of material behavior from the smallest atomic scale to the macro scale. However the uncertainties associated with these approaches and models across different scales need to be addressed to enable decision making resulting in designs that are robust that is relatively insensitive to uncertainties. An approach that facilitates co design is needed across material product design and manufacturing processes. This book describes a cloud based platform to support decisions in the design of engineered systems (CB-PDSIDES) which feature an architecture that promotes co design through the servitization of decision making, knowledge capture and use templates that allow previous solutions to be reused. Placing the platform in the cloud aids mass collaboration and open innovation. A valuable reference resource reference on all areas related to the design of materials, products and processes the book appeals to material scientists, design engineers and all those involved in the emerging interdisciplinary field of integrated computational
