Modelling the Dispersion of Radionuclides in the Marine Environment Raúl Perriáñez, 2005-03-07 This guide details the techniques and numerical procedures required for numerical modelling of radioactivity dispersion in marine environments The book goes beyond the basics of hydrodynamic modeling to analyze the latest trends in modeling **Modelling**

**Radioactivity in the Environment** E.M. Scott, 2003-05-22 Just as an environmental model typically will be composed of a number of linked sub models representing physical chemical or biological processes understood to varying degrees this volume includes a series of linked chapters exemplifying the fundamental nature of environmental radioactivity models in all compartments of the environment Why is a book on modelling environmental radioactivity necessary There are many reasons why such a book is necessary perhaps the most important that modelling is an often misunderstood and maligned activity and this book can provide to a broad audience a greater understanding of modelling power but also some of the limitations modellers and experimentalists often do not understand and mistrust each other's work yet they are mutually dependent in the sense that good experimental science can direct good modelling work and vice versa we hope that this book can dispel mistrust and engender improved understanding there is an increasing reliance on model results in environmental management yet there is also often misuse and misrepresentation of these results This book can help to bridge the gap between unrealistic expectations of model power and the realisation of what is possible practicable and feasible in modelling of environmental radioactivity and finally modelling tools capacity and power have increased many fold in a relatively short period of time Much of this is due to the much heralded computer revolution but much is also due to better science It is useful to consider what gap if any still remains between what is possible and what is necessary **Remote Sensing for**

**Geophysicists** Mukesh Gupta, 2025-03-05 Geophysical exploration methods are very expensive and invasive methods for surveys Remote sensing methods are non invasive and much cheaper for investigating the Earth's surface This book bridges this gap and aims to integrate exploration geophysics with remote sensing as a cost effective method which is easy to implement for prospecting in different areas It provides exploration geophysicists with the necessary information to use advanced remote sensing technology in the exploration of oil and gas minerals and groundwater It describes the integration of remote sensing in each of the nine exploration methods based on over 11 case studies from different countries across the globe Features Describes the geophysical exploration methods that geophysicists frequently use along with suitable remote sensing techniques Offers a well structured one stop guide for finding a suitable remote sensing technique for a specific geophysical exploration method Provides case studies on the exploration of oil gas and groundwater with step by step instructions using remote sensing technology Serves as a practical field book for exploration geophysicists who never used or rarely use remote sensing Enables exploration geophysicists to understand and interpret remote sensing data for the assessment of complex explorations This book is an excellent resource for professionals researchers academics and students

Winterwerp, C. Kranenburg, 2002-06-05 Cohesive sediment or mud is encountered in most water bodies throughout the world Often mud is a valuable resource synonymous with fertile land enriching the natural environment and used as an important building material Yet mud also hinders navigation and consequently dredging operations have been carried out since ancient times to safeguard navigation Unfortunately many mud deposits are now contaminated endangering the eco system and increasing the costs of dredging

operations The transport and fate of mud in the environment are still poorly understood and the need for basic research remains This text contains the proceedings of the INTERCOH 2000 conference on progress in cohesive sediment research It was the sixth in a series of conferences initially started by Professor Ashish Mehta in 1984 as a Workshop on Cohesive Sediment Dynamics with Special Reference to the Processes in Estuaries During these conferences the character of the first workshop has always been maintained that is small scale and dedicated to the physical and engineering aspects of cohesive sediments without parallel sessions but with ample time for discussions during and after the presentations and followed by a book of proceedings containing thoroughly reviewed papers INTERCOH 2000 was integrated with the final workshop of the COSINUS project This project was carried out as a part of the European MAST 3 programme and almost all European cohesive sediment workers were involved INTERCOH 2000 focused on the behaviour and modelling of concentrated benthic suspensions i e high concentrated near bed suspensions of cohesive sediment Special attention was paid to sediment turbulence interaction flocculation and settling velocity high concentrated mud suspensions processes in the bed consolidation processes on the bed erosion field observations on mud dynamics instrumentation and numerical modelling
