The Future of Geological Modelling in Hydrocarbon Development Adam Robinson, 2008 The 3D geological model is still regarded as one of the newest and most innovative tools for reservoir management purposes The computer modelling of structures rock properties and fluid flow in hydrocarbon reservoirs has evolved from a specialist activity to part of the standard desktop toolkit The application of these techniques has allowed all disciplines of the subsurface team to collaborate in a common workspace In today's asset teams the role of the geological model in hydrocarbon development planning is key and will be for some time ahead The challenges that face the geologists and engineers will be to provide more seamless interaction between static and dynamic models This interaction requires the development of conventional and unconventional modelling algorithms and methodologies in order to provide more risk assessed scenarios thus enabling geologists and engineers to better understand and capture inherent uncertainties at each aspect of the geological model's life

Water Wave Kinematics A. Tørum, O.T. Gudmestad, 2012-12-06 Water wave kinematics is a central field of study in ocean and coastal engineering. The wave forces on structures as well as sand erosion both on coastlines and in the ocean are to a large extent governed by the local distribution of velocities and accelerations of the water particles. Our knowledge of waves has generally been derived from measurements of the water surface elevations. The reason for this is that the surface elevations have been of primary interest and fairly cheap and reliable instruments have been developed for such measurements. The water wave kinematics has then been derived from the surface elevation information by various theories. However, the different theories for the calculation of water particle velocities and acceleration have turned out to give significant differences in the calculated

responses of structures In recent years new measurement techniques have made it possible to make accurate velocity measurements Hence the editors deemed it to be useful to bring together a group of experts working actively as researchers in the field of water wave kinematics These experts included theoreticians as well as experimentalists on wave kinematics It was also deemed useful to include experts on the response of structures to have their views from a structural engineering point of view on what information is really needed on water wave kinematics

Hydraulics in Civil and Environmental Engineering Andrew Chadwick, John Morfett, Martin Borthwick, 2021-06-07 This classic text now in its sixth edition combines a thorough coverage of the basic principles of civil engineering hydraulics with a wide ranging treatment of practical real world applications It now includes a powerful online resource with worked solutions for chapter problems and solution spreadsheets for more complex problems that may be used as templates for similar issues Hydraulics in Civil and Environmental Engineering is structured into two parts to deal with principles and more advanced topics The first part focuses on fundamentals such as hydrostatics hydrodynamics pipe and open channel flow wave theory physical modelling hydrology and sediment transport The second part illustrates engineering applications of these principles to pipeline system design hydraulic structures river and coastal engineering including up to date environmental implications as well as a chapter on computational modelling illustrating the application of computational simulation techniques to modern design in a variety of contexts New material and additional problems for solution have been added to the chapters on hydrostatics pipe flow and dimensional analysis The hydrology chapter has been revised to reflect updated UK flood estimation methods data and software The recommendations regarding the assessment of uncertainty climate change predictions impacts and adaptation measures have been updated as has the guidance on the application of computational simulation techniques to river flood modelling Andrew Chadwick is an honorary professor of coastal engineering and the former associate director of the Marine Institute at the University of Plymouth UK John Morfett was the head of hydraulics research and taught at the University of Brighton UK Martin Borthwick is a consultant hydrologist formerly a flood hydrology advisor at the UK s Environment Agency and previously an associate professor at the University of Plymouth UK
