

SEAGRASS

SEAGRASS BEDS SUPPORT THOUSANDS OF MARINE SPECIES, STORE CARBON, IMPROVE WATER QUALITY, PROTECT COASTLINES, CYCLE NUTRIENTS AND CREATE HABITAT CORRIDORS BETWEEN CORAL REEFS AND MANGROVES.

BIODIVERSITY

Thousands of species rely on seagrass, including fish, marine mammals, birds, and invertebrates. Several of these are endangered species such as dugongs and manatees.

FOOD

Seagrass supports a diverse food web from herbivores that eat grass and algae to carnivores that prey on these and invertebrates that consume dead seagrass matter.

OXYGEN

Seagrass produces oxygen through photosynthesis, which marine species need to breathe.

WATER QUALITY

Seagrass slows silt and nutrient runoff, helping improve water quality and reduce coastal erosion.

HABITAT CORRIDORS

Seagrass beds create ecological corridors between different habitats allowing species to move between them.

NUTRIENT CYCLING

Seagrass supports a diverse food web from herbivores that eat grass and algae to carnivores that prey on these and invertebrates that consume dead seagrass matter.

CLIMATE RESILIENCE

Seagrass can remove carbon dioxide and methane from the atmosphere and store it in the seagrass beds. Seagrass can also help coastal communities adapt to climate change by reducing the risk of coastal erosion and flooding.

CARBON STORAGE

Seagrass stores carbon from seawater in photosynthesis and roots. This helps reduce the impacts of climate change.

LIVELIHOODS

Seagrass supports a diverse food web from herbivores that eat grass and algae to carnivores that prey on these and invertebrates that consume dead seagrass matter.

SHELTER

Many species rely on seagrass as nursery areas to shelter their young while they mature.

Seagrass Ecology:

Seagrass Ecology Marten A. Hemminga, Carlos M. Duarte, 2000-10-19 Seagrasses occur in coastal zones throughout the world in the part of the marine habitat that is most heavily influenced by humans Decisions about coastal management therefore often involve seagrasses but a full appreciation of the role of seagrasses in coastal ecosystems has yet to be reached This book provides an entry point for those wishing to learn about the ecology of this fascinating group of plants and gives a broad overview of current knowledge complemented by extensive literature references to guide the reader to more detailed studies

Seagrasses: Biology, Ecology and Conservation Anthony W. D. Larkum, Robert J. Orth, Carlos Duarte, 2007-05-16 Seagrasses are unique plants the only group of flowering plants to recolonise the sea They occur on every continental margin except Antarctica and form ecosystems which have important roles in fisheries fish nursery grounds prawn fisheries habitat diversity and sediment stabilisation Over the last two decades there has been an explosion of research and information on all aspects of seagrass biology However the compilation of all this work into one book has not been attempted previously In this book experts in 26 areas of seagrass biology present their work in chapters which are state of the art and designed to be useful to students and researchers alike The book not only focuses on what has been discovered but what exciting areas are left to discover The book is divided into sections on taxonomy anatomy reproduction ecology physiology fisheries management conservation and landscape ecology It is destined to become the chosen text on seagrasses for any marine biology course

Seagrass Robert S. Pirog, 2011 Seagrasses are flowering plants from one of four plant families all in the order Alismatales which grow in marine fully saline environments Seagrasses are sometimes labelled ecosystem engineers because they partly create their own habitat the leaves slow down water currents increasing sedimentation and the seagrass roots and rhizomes stabilise the seabed Their importance for associated species is mainly due to provision of shelter and for their extraordinarily high rate of primary production This book presents current research in the study of seagrass including ecosystem modelling of seagrass beds *P. oceanica* population genetics and proteomics the impact of hurricanes on seagrass *Thalassia testudinum* in the Caribbean Sea GIS mapping of seagrass meadows and the rise of *Ruppia* in seagrass beds
