Climate Change Kristen St. John, Lawrence

Krissek,2025-08-22 This open access book on climate change assesses past climatic change from a geoscience perspective and directly and effectively addresses common misconceptions on climate and climate change A geoscience perspective on the multiple causes rates and consequences of climate change is essential context to assess modern climate change and our role in it as well as forecasting future climate conditions Yet most textbooks on climate change focus only on the very recent past e g last century are not sufficiently engaging for non scientists or explore paleoclimate science at a level too challenging for introductory students In addition a wide range of misconceptions and confusion exists in the general public about climate change Correcting misconceptions is an essential aspect of education but educational research has shown that it is challenging to achieve This textbook includes introductions to each thematic Part that directly identify relevant misconceptions and refute them with clear concise messages i e learning goals that are grounded in science and expanded on in the supporting chapters Such refutation style approaches have been shown to be effective at addressing misconceptions The book offers a clear trajectory of fundamental climate science concepts which are most beneficially combined to provide a valuable geoscience perspective on the causes rates and consequences of climate change It frames the collection of climate science chapters with impactful relevant social science context starting the book with a chapter that explores the reasons behind the disconnect between the scientific and public understanding of climate change and ending the book with a discussion of the intersection of ethics and climate change Short topical expansions or excursions are included as boxes within selected chapters This book will serve as a basic resource for learning about the lessons that the paleoclimate record offers to evaluate the seriousness of modern and future climate change [Colour and Light in the Ocean](#) Victor Martinez-Vicente,Astrid Bracher,Didier Ramon,Shubha Sathyendranath,Tiit Kutser,2020-03-26 CLEO publications in Frontiers in Marine Science Foreword Josef Aschbacher Director of ESA s Earth Observation Programmes Satellite data have drastically changed the view we have of the oceans Covering about 70% of Earth s surface oceans play a unique role for our planet and for our life but large areas remain unexplored and are difficult to reach Since the 1980s Earth orbiting satellites have helped to observe what is happening at the ocean surface Sensors like CZCS AVHRR SeaWiFS and MODIS provided the first ocean colour data from space Starting in 2002 ESA s Medium Resolution Imaging Spectrometer MERIS on board the environmental satellite Envisat provided detailed information on phytoplankton biomass and concentrations of other matter in the global oceans These satellite observations laid the groundwork for studying the marine environment and how it responds to climate change and the research community has since delivered information on the variability of marine ecosystems Part of this work is reflected in this stunning collection of peer reviewed publications presented at the workshop

Colour and Light in the Ocean from Earth Observation CLEO held at ESA's ESRIN site in Frascati Italy on 6-8 September 2016. The event attracted more than 160 participants from all over the world including remote sensing experts, marine ecosystem modelers, in situ observers and users of Earth observation data. Scientifically, the meeting covered applications in climate studies over primary productivity and ocean dynamics to pools of carbon and phytoplankton diversity at global and regional scales. It also demonstrated the potential of Earth observation and its contribution to modern oceanography. Looking to the future, new satellites developed by ESA under the coordination of the European Commission will further our scientific and operational observations of the seas. With Sentinel 3A in orbit and its twin Sentinel 3B following in 2017, there is a new category of data available for operational oceanographic applications and climate studies for years to come. These data are free and easy to access by anyone interested. Looking at the role of oceans in our daily lives, I am sure that this collection of scientific excellence will be valued by scientists of today and will inspire the next generation to carry these ideas into the future.
