gases after carbon dioxide and methane. As this book describes, although it only comprises 320 parts per billion of the earth's atmosphere, it has a so-called Global Warming Potential nearly 300 times greater than that of carbon dioxide. N<sub>2</sub>O emissions are difficult to estimate because they are predominantly biogenic in origin. The N<sub>2</sub>O is formed in soils and oceans throughout the world by the microbial processes of nitrification and denitrification that utilise the reactive N compounds ammonium and nitrate respectively. These forms of nitrogen are released during the natural biogeochemical nitrogen cycle but are also released by human activity. In fact, the quantity of these compounds entering the biosphere has virtually doubled since the beginning of the industrial age, and this increase has been matched by a corresponding increase in N<sub>2</sub>O emissions. The largest source is now agriculture, driven mainly by the use of synthetic nitrogen fertilisers. The other major diffuse source derives from release of NO<sub>x</sub> into the atmosphere from fossil fuel combustion and biomass burning, as well as ammonia from livestock manure. Some N<sub>2</sub>O also comes directly from combustion and from two processes in the chemical industry: the production of nitric acid and the production of adipic acid used in nylon manufacture. Action is being taken to curb the industrial point source emissions of N<sub>2</sub>O, but measures to limit or reduce agricultural emissions are inherently more difficult to devise. As we enter an era in which measures are being explored to reduce fossil fuel use and/or capture or sequester the CO<sub>2</sub> emissions from the fuel, it is likely that the relative importance of N<sub>2</sub>O in the Kyoto basket of greenhouse gases will increase, because comparable mitigation measures for N<sub>2</sub>O are inherently more difficult and because expansion of the land area devoted to crops to feed the increasing global population and to accommodate the current development of biofuels is likely to lead to an increase in N fertiliser use and thus N<sub>2</sub>O emission worldwide. The aim of this book is to provide a synthesis of scientific information on the primary sources and sinks of nitrous oxide and an assessment of likely trends in atmospheric concentrations over the next century and the potential for mitigation measures.

*Remote Sensing and Atmospheric Ozone* Arthur Philip Cracknell, Costas Varotsos, 2012-06-21. The destruction of the ozone layer together with global warming is one of the hot environmental topics of today. This book examines the effect of human activities on atmospheric ozone, namely the increase of tropospheric ozone and the general diminution of stratospheric ozone and the production of the Antarctic ozone hole. Also discussed is the role of remote sensing techniques in the understanding of the effects of human activities on atmospheric ozone, as well as in the development of social and political awareness of the damage to the ozone layer by man-made chemicals, principally CFCs. This led to the formulation and ratification in 1989 of the Montreal Protocol on controlling banning the manufacture and use of chemicals that damage the ozone layer. Since then, remote sensing has played a key role

in monitoring atmospheric ozone concentration and determining the success of the Montreal Protocol in protecting the ozone layer from further damage In this book the renowned authors discuss the sophisticated instruments that have been launched into space to study not only ozone but also other trace gases in the atmosphere some of which play a key role in the generation and destruction of ozone in the atmosphere Professors Cracknell and Varotsos also examine the satellite flown instruments which are involved in monitoring the absorption of solar ultraviolet light in the atmosphere in relation both to the generation and destruction of ozone and consequently to human health This scholarly book written by the foremost experts in the field looks at remote sensing and its employment in the various aspects of ozone science It is widely acknowledged that global warming due to anthropogenic greenhouse gases emissions represents a threat to the sustainability of human life on Earth However many other threats are potentially just as serious including atmospheric pollution ozone depletion water pollution the degradation of agricultural land deforestation the depletion of the world s mineral resources and population growth *Protecting the Ozone Layer* Edward Parson,2003 Providing an account of the ozone depletion issues from the attempts to develop international action in the 1970s to the mature functioning of the international regime this book examines the parallel developments of politics and negotiations technological progress and industry strategy that shaped the issue s development and its management **Natural Production of Organohalogen**

**Compounds** Gordon W. Gribble,2005-07-25 This book summarizes the state of the art knowledge on naturally occurring organohalogens of which more than 3700 are documented The chapters cover all aspects of this field including the structural diversity and sources of organohalogens the mechanisms for their formation and biodegradation the clinical use of dichloroacetate and the synthesis of the powerful anticancer chlorine containing cryptophycin Both biogenic and abiogenic sources of organohalogens are treated the latter of which include volcanic emissions and abiogenic formation in soil Halogenation in humans fungi and in the ocean are covered in separate chapters Sources and biosynthesis of the relatively rare natural organofluorines are also discussed in this volume By better understanding of the role nature plays in the area of organohalogens we can more intelligently regulate the production use and disposal of man made organohalogen compounds
