Running Walking And Jumping The Science Of Locomotion:

Running, Walking and Jumping Anne Innis Dagg,1977 **Fundamental Biomechanics of Sport and Exercise**

James Watkins,2014-03-26 Fundamental Biomechanics of Sport and Exercise is an engaging and comprehensive introductory textbook that explains biomechanical concepts from first principles showing clearly how the science relates to real sport and exercise situations The book is divided into two parts The first provides a clear and detailed introduction to the structure and function of the human musculoskeletal system and its structural adaptations essential for a thorough understanding of human movement The second part focuses on the biomechanics of movement describing the forces that act on the human body and the effects of those forces on the movement of the body Every chapter includes numerous applied examples from sport and exercise helping the student to understand how mechanical concepts describe both simple and complex movements from running and jumping to pole vaulting or kicking a football In addition innovative worksheets for field and laboratory work are included that contain clear objectives a description of method data recording sheets plus a set of exemplary data and worked analysis Alongside these useful features are definitions of key terms plus review questions to aid student learning with detailed solutions provided for all numerical questions No other textbook offers such a clear easy to understand introduction to the fundamentals of biomechanics This is an essential textbook for any biomechanics course taken as part of degree programme in sport and exercise science kinesiology physical therapy sports coaching or athletic training

Energetics of Human Activity William Anthony Sparrow,2000 Energetics of Human Activity provides a detailed contemporary discussion of the efficiency of movement from a multidisciplinary perspective The text explores the process by which humans optimize their energy expenditure in learning and controlling movements As the first collaborative text that focuses on the energetics of motor coordination and control Energetics of Human Activity is written by 24 international researchers in the movement sciences including noted experts from the fields of psychology physiology and biomechanics This presents the reader with a broad range of opinions and research findings Collectively the chapters discuss three topics of interest from a movement economy perspective individual differences motor learning and the control of action The hypothesis that minimization of metabolic energy expenditure is a universal constraint on the structure of emerging movement patterns is also presented by three movement subdiscipline perspectives These approaches include the mechanics of human motion the physiological cost of meeting task demands and the effects of practice on performance Each chapter provides a systematic basis for examining metabolic energy expenditure presents the research findings that support the contention that energy expenditure regulates the development of movement patterns and makes valuable suggestions to stimulate future research The text also contains more than 100 figures that are clear and easy to interpret making the information simple to understand Energetics of Human Activity is a unique text that provides a complete perspective on metabolic energy expenditure from various disciplines It is an invaluable resource for movement science professionals

Carnivore Behavior, Ecology, and Evolution John L. Gittleman, 2019-05-15 The mammalian order Carnivora is characterized by an incredible range of morphological ecological and behavioral variation Carnivores can be as small as the 100 gram least weasel or as large as the 800 kilogram polar bear Their reproductive rate can vary from one offspring every five years as with some black bears to three litters a year as with the dwarf mongoose Group sizes can be traced along a wide continuum from the solitary ermine to the monogamous golden jackal to the large extended packs of as many as 80 spotted hyenas Until recently the general habits of most wild carnivore species were inadequately understood In the last decade however improved technologies including the use of radiotelemetry and night vision scopes have led to many important discoveries This book is at once a critical summary and an evaluation of current research on carnivores A worthy successor to R F Ewer's monumental volume *The Carnivores* Cornell University Press it is the work of 30 leading carnivore biologists who here assemble comparative data on the basic anatomical behavioral ecological physiological reproductive and evolutionary characteristics of this group After a general introduction to the Carnivora the volume is divided in three parts each of which begins with a brief introduction outlining its main themes Part I Behavior covers acoustic and olfactory communication behavioral development behavioral ecology of canids and hyaenids modes of solitary living and group living In Part II Ecology topics include feeding ecology of the giant panda and Asiatic black bear adaptations for aquatic living ecological constraints on predation in felids consequences of small size in mustelids rate of basal metabolism and food habits and reproductive output Part III Evolution deals with the morphological approaches to phylogeny and the fossil record An appendix presents a complete classification of the Carnivora including topics of continuing controversy Highlighting recent developments in the study of the Carnivora and areas for further research this broad synthesis will be of great value of students and researchers in animal behavior behavioral ecology wildlife ecology mammalogy paleontology systematics and evolution theory It will also encourage realistic conservation programs to manage rapidly diminishing populations and will elucidate particular features of the carnivores for nonspecialist readers

Understanding Mammalian Locomotion John E. A. Bertram, 2016-01-22 Understanding Mammalian Locomotion will formally introduce the emerging perspective of collision dynamics in mammalian terrestrial locomotion and explain how it influences the interpretation of form and functional capabilities The objective is to bring the reader interested in the function and mechanics of mammalian terrestrial locomotion to a sophisticated conceptual understanding of the relevant mechanics and the current debate ongoing in the field
