Les Sciences de la terre aux XVIIe et XVIIIe siècles Gabriel Gohau, 2014-04-01 Chacun sait que la science n'a eu de but du XVIIe siècle lorsque Kepler Galilée et Descartes notamment ont couvert les bases de l'astronomie et de la mécanique. Pourtant les sciences de la vie et de la terre ne suivent pas le mouvement. Malgré les efforts d'exploration et de classification du monde vivant et du domaine minéral, ces disciplines ne prendront leur essor qu'au début du XIXe siècle. Ce travail, comme celui de Guyot, se situe donc dans l'entre-deux des révolutions scientifiques. Notre souhait finalement sera que le lecteur prenne assez de goût ces lectures pour les prolonger en allant aux auteurs cités dans les bibliographies chez les bouquinistes ou dans les éditions modernes qui se multiplient et qui, sans avoir le charme des livres anciens, sont un moyen commode et bon marché d'accéder au fonds de notre littérature scientifique des siècles passés. **Water Resources in Algeria - Part I** Abdelazim M. Negm, Abdelkader Bouderbala, Haroun Chenchouni, Damià Barceló, 2020-10-23 This book reviews the latest information on the assessment of surface and groundwater resources in Algeria. The authors cover a large diversity of topics including the status and assessment of water resources, impacts of pesticides, soil droughts, analysis of flood characteristics, hydrogeological investigations and modeling applications and evapotranspiration. Special attention is given to the impacts of climate changes on water resources. The assessment methods present in this book can be used or adapted to study other regions of North Africa, Middle East and/or in the Mediterranean with similar climate conditions as Algeria. This book and the companion volume *Water Resources in Algeria Part II: Water Quality, Treatment, Protection and Development* will appeal to engineers, researchers, graduate students and policymakers interested in the field of groundwater and surface water assessment.

Copyright Electre. **Seismic Ground Motion in Large Urban Areas** Giuliano F. Panza, Ivanka Pakaleva, Concettina Nunziata, 2012-12-06 The accelerated and often uncontrolled growth of the cities has contributed to the ecological transformation of their immediate surroundings. Factors contributing to the urban vulnerability include lowering or rising of the water table, subsidence, loss of bearing capacity of soil foundations and instability of slopes. Recent catastrophic earthquakes highlight the poor understanding by decision makers of seismic-related risk as well as the tendency of some builders to use the cheapest designs and construction materials to increase short-term economic returns on their investment. Losses from earthquakes will continue to increase if we do not shift towards proactive solution. Disaster reduction is both an issue for consideration in the sustainable development agenda and a cross-cutting issue relating to the social, economic, environmental and humanitarian sectors. As location is the key factor which determines the

level of risk associated with a hazard land use plans and mapping should be used as tools to identify the most suitable usage for vulnerable areas
