Food Safety Management Y. Motarjemi, G.G. Moy, P.J. Jooste, L.E. Anelich, 2013-11-01 In many countries of the world the dairy industry is one of the most important food sectors and it has by and large been very successful in providing safe products Nevertheless the dairy sector like other food sectors also has its challenges as from farm to the point of consumption dairy products can become contaminated with a broad range of microbial and chemical hazards The sources of contamination are multiple and the pathways are complex Contamination of milk can occur directly by dairy animals shedding pathogens into the milk or indirectly by contamination of the milk during the milking process collection and transportation Infected animals or asymptomatic carriers can shed the organisms in the feces and contaminate the milk through the environment Other sources of environmental contamination are water pests soil feces pets and contaminated feed Infected farmers not respecting hand hygiene are also a potential source of contamination of milk During milking collection and transportation milk can be subjected to further contamination by the equipment and or be subjected to time temperature abuse creating optimum conditions for microbial growth Hence ensuring safety of milk and dairy products starts on the farm with animal health quality of feed a hygienic environment and in general good animal husbandry Nevertheless pasteurization of milk is necessary to kill any surviving organisms and reduce the risk of illness to an acceptable level Provided that hygienic measures are taken to prevent any post process contamination milk and dairy products can be produced and consumed safely The present chapter reviews risks and control measures all along the

production chain **Food Safety Management** John N. Sofos,2013-11-01 Microbial contamination of meat and meat products is unavoidable as microorganisms are present on animals and in their environment Thus raw and not fully heated commercially processed or otherwise processed preserved e g frozen fermented dried high hydrostatic pressure processed irradiated meat and meat products are prone to spoilage and compromised safety due to microbial presence and growth Raw meat products although few consumers eat certain meat products raw or undercooked intentionally or accidentally a practice not recommended need further processing and or cooking before consumption This makes them shelf stable or semi perishable and safe for consumption or ready to eat In general the shelf life quality and safety of meat and meat products are extended and improved through adequate processing appropriate marketing storage and preparation for consumption under properly clean sanitary and hygienic conditions following an integrated approach throughout all sectors of the food supply web including producers processors distributors retailers as well as consumers The strategy for hazard control should include 1 good animal production practices on the farm 2 slaughtering of animals that are disease free 3 processing of carcasses and meat in properly designed and maintained facilities and under sanitary and hygienic conditions 4 use of decontamination intervention strategies if approved to reduce microbial levels when needed 5 thermal processing freezing drying fermentation acidification use of approved antimicrobials in certain products and packaging 6 maintenance of proper cold chain conditions during distribution 7 proper storage and preparation procedures by food service and consumers and 8 management of every segment of this common sense but complex system with well validated verified and documented programs such as the hazard analysis critical control point HACCP system **Rapid Detection, Characterization, and Enumeration of Foodborne Pathogens** J. environment and processing equipment and testing of raw materials in process and finished products The relevance and application of testing programs depend upon the design of the product and process the hygienic status of the processing environment and the availability of other verification information about a product lot The design and implementation of environmental monitoring programs consider the areas of product exposure and the potential impact of the movement of people materials and product on product contamination Raw material testing programs consider the inherent risk of the material its use in the process and the confidence in the supplier determined by supplier audits and ongoing performance Finished product testing programs consider customer and regulatory requirements and the hygienic status of the process and production environment Due to statistical and temporal limitations microbiological testing programs are most effective when used along with risk based preventive controls such as HACCP hygienic zoning and other prerequisite programs and when they work together with other verification activities to assess the condition of a food safety system
