Monitoring Of Cerebral Blood Flow And Metabolism In Intensive Care Acta Neurochirurgica Supplementum S:

Monitoring of Cerebral Blood Flow and Metabolism in Intensive Care Andreas W. Unterberg, Gerd-Helge Schneider, Wolfgang R. Lanksch, 2012-12-06 Until recently monitoring of cerebral blood flow and metabolism was an unattained goal Determination of cerebral blood flow was limited to intermittent measurements and particularly difficult to perform in critically ill patients Meanwhile there are techniques available however to monitor cerebral blood flow and cerebral oxygenation both globally and regionally Therefore we thought it worthwhile to discuss these new continuous techniques and to compare them with well known techniques which discontinuously measure CBF For that purpose an international workshop with some leading experts in the field was held in October 1992 in Berlin The workshop consisted of about 20 lectures either reviews on a special topic or latest results These contributions were given by invitation and were extensively discussed Unfortunately it is impossible to reproduce the discussions On the other hand all speakers delivered a manuscript promptly after the meeting so that we were able to edit them within a short time Since monitoring of cerebral blood flow in intensive care is a rapidly growing and changing topic the written contributions should be quickly available Authors editors and publishers have tried to come close to this ideal As editors we would like to thank the authors and the publishers who enabled us to come out with this volume of the proceedings as early as possible **Neurocritical Care**

Monitoring Chad M. Miller, Michel Torbey, Michel T. Torbey, 2014-10-10 I commend the editors for their careful perspective on the current state of neuromonitoring The individual chapters provide excellent overviews of specific neuromonitoring tools and paradigms From the Foreword by J Claude Hemphill III MD MAS FNCS While damage resulting from a primary injury to the brain or spine may be unavoidable harm from secondary processes that cause further deterioration is not This practical clinical resource describes the latest strategies for monitoring the brain after acute injury With a focus on individualization of treatment the book examines the role of various monitoring techniques in limiting disability and potentiating patient recovery during the acute phase of brain injury International experts in diagnosis and treatment of secondary injury explain in detail the current utilization benefits nuances and risks for each commercially available monitoring device as well as approaches vital to the care of brain and spine injured patients They cover foundational strategies for neuromonitoring implementation and analysis including proper catheter placement duration of monitoring and treatment thresholds that indicate the need for clinical intervention The book also addresses multimodality monitoring and common programmatic challenges and offers guidance on how to set up a successful multimodal monitoring protocol in the ICU Also included is a chapter on the key role of nurses in neuromonitoring and effective bedside training for troubleshooting and proper execution of treatment protocols Numerous illustrations provide further illumination Key Features Presents state of the art neuromonitoring techniques and clinical protocols for assessment and treatment Emphasizes practical implementation for successful patient outcomes Written by international experts at the forefront of neurocritical care

monitoring Provides a framework for practitioners who wish to individualize patient care with an emphasis upon the needs of the critically ill brain Discusses the key role of nurses in neuromonitoring and effective bedside training for management and troubleshooting of devices Advanced Practice in Critical Care Sarah McGloin, Anne McLeod, 2010-02-09 Advanced Practice in Critical Care provides experienced critical care nurses with a clear and distinct evidence base for contemporary critical care practice Central to the book is the application of research and evidence to practice and therefore case studies and key critical care clinical situations are used throughout to guide the reader through the patient care trajectory Each chapter introduces an initial patient scenario and as the chapter progresses the patient scenario develops with the theoretical perspectives and application In this way it is evident how multi organ dysfunction develops impacting upon and influencing other body systems demonstrating the multi organ impact that is often experienced by the critically ill patient In this way consequences of critical illness such as acute renal failure haemostatic failure and liver dysfunction are explored Throughout the text key research findings and critical care treatment strategies are referred to applied and evaluated in the context of the given patient case study Advanced assessment techniques are explained and the underlying pathophysiology is discussed in depth Advanced Practice in Critical Care is an essential resource for experienced practitioners within critical care whom primarily care for patients requiring high dependency or intensive care Surgically Treated Intracerebral Haemorrhage Lovisa Tobieson, 2019-04-17 Mortality and morbidity of intracerebral haemorrhage ICH is excessively high and the case fatality rate has not improved in the last decades Although surgery for ICH can be life saving no positive effect on functional outcome has been found in large cohorts of ICH patients Increased understanding of the pathophysiology of ICH is needed to develop improved treatment strategies In 17 ICH patients paired cerebral microdialysis CMD catheters were inserted in the perihemorrhagic zone PHZ and in normal uninjured cortex at time of surgery Despite normalisation of cerebral blood flow a persistent metabolic crisis indicative of mitochondrial dysfunction was detected in the PHZ This metabolic pattern was not observed in the uninjured cortex CMD was also used to sample proteins for proteomic analysis A distinct proteome profile that changed over time was found in the PHZ when compared to the seemingly normal uninjured cortex However protein adsorption to CMD membranes which may interfere with concentration measurements was substantial Surgical treatment of 578 ICH patients was analysed in a nation wide retrospective multi centre study in Sweden over five years Patients selected for surgery had similar age pre operative level of consciousness and co morbidity profiles but ICH volume and the proportion of deep seated ICH differed among the six neurosurgical centres Furthermore there was variability in the post operative care including the use and duration of intracranial pressure monitoring cerebrospinal fluid drainage and mechanical ventilation In conclusion the results of this thesis show that i Despite surgical removal of an ICH a metabolic crisis caused by mitochondrial dysfunction a potential future therapeutic target persists in the perihemorrhagic zone ii iii CMD is a valuable tool in ICH research for sampling novel biomarkers using proteomics which may aid in the development of improved therapeutic

interventions However caveats of the technique such as protein adsorption to the CMD membrane must be considered iv The nation wide study illustrates similar clinical features in patients selected for ICH surgery but substantial variability in ICH volume and location as well as neurocritical care strategies among Swedish neurosurgical centres Development of refined clinical guidelines may reduce such intercentre variability and lead to improved functional outcome for ICH patients *Acta neurologica Belgica* ,1970
