Whittaker,2012-12-06 One of the most impressive works of scholarship in the field of experimental pharmacology has been the Heffter Heubner Handbuch der experimentellen Pharmakologie internationalized some years ago under the title

Handbook of Experimental Pharmacology and kept up to date by a series of numbered Ergänzungswerke or supplementary volumes which have now replaced in importance the original Handbuch. These volumes constitute a valuable and continuously up dated multi author review series of topics important in modern pharmacology and allied sciences. The Editorial Board of the Handbook invited me 2 years ago to undertake as subeditor the preparation of a new volume entitled The Cholinergic Synapse. A previous volume in this series vol 15 Cholinesterases and Anticholinesterase Agents edited by GEORGE KOELLE was published in 1963 and was far wider in scope than its title suggested it was in fact an authoritative summing up of the whole subject of cholinergic function and still has some value today as an account of the state of the art as it was at that time. Since then another excellent review of a specific cholinergic synapse has appeared in this series this was vol 42 Neuromuscular Junction edited by ELEANOR ZAIMIS and published in 1976. A third volume vol 53 Pharmacology of Ganglionic Transmission which appeared in 1980 and was edited by D A KHARKEVICH includes important aspects of autonomic cholinergic function.

High-Performance Liquid Chromatography of Peptides and Proteins Colin T. Mant, Robert S. Hodges, 2017-11-22. This book consists of a series of 82 precise easy to read articles by internationally renowned scientists and emphasizes the practical approach to HPLC with minimal theory although the underlying principles for peptide and protein separations are clearly expressed. All of the major modes of microbore ultrafast and analytical HPLC are discussed including size exclusion ion exchange reversed phase hydrophobic interaction and affinity and immunoaffinity chromatography. A section on preparative HPLC including displacement techniques is also presented. Problem solving approaches to the separation of various classes of biologically active peptides and proteins are thoroughly explored while the importance of peptide standards for monitoring column performance and for optimizing separation conditions is emphasized. Several articles focus on the choice of the correct detection method electrochemical UV fluorescence as well as the need for a proper knowledge of approaches to column and instrument maintenance and trouble shooting. A section on predictive approaches deals with both computer simulation of peptide separations and peptide structure. The book also includes complementary techniques to HPLC as well as other useful applications of HPLC. It enables both novice and experienced chromatographers to realize the full potential of this extremely powerful technique in the process making an important contribution to scientific literature.

Images of Biologically Active Structures in the Immune System Hilary Koprowski, Fritz Melchers, 2012-12-06. The diversity of antigen binding structures of antibody molecules is so vast that every conceivable antigen can be bound by an antibody molecule within the immune system. This is true even for the antigen binding sites of antibodies called idiotypes which are bound by complementary binding sites of other antibodies called anti idiotypes. Thus anti idiotypes are structural homologues of antigens. These idiotypic anti idiotypic interactions constitute a network within the immune system. Since one lymphocyte produces only one type of antibody molecule this network is in fact a network of cells. We expect that the network is functional the appearance of antigen will

disturb the equilibrium of the network at the point where it competes with the anti idiotypic lymphocyte for binding to the idiotypic lymphocyte. It has been known for quite some time that anti idiotypic antibody can be used to prime the immune system for memory to an antigen that it has never seen. This phenomenon is now being explored for possible use in immunization against viruses, bacteria, parasites and tumors as well as for the modulation of autoimmunity. The ability of anti idiotypes to mimic both antigenically and functionally the corresponding biologically active molecules seen by an idiotypic antibody was first demonstrated for the hormone insulin and is now being observed in many other systems. The papers assembled in this volume bring the reader to the cutting edge of the potential practical applications of the network theory of the immune system.

Anti-Idiotypic Vaccines Pierre-Andre Cazenave, 2012-12-06

Vaccines have historically been considered to be the most cost effective method for preventing communicable diseases. It was a vaccine that enabled global eradication of the dreaded disease smallpox. Mass immunization of children forms the anchor of the strategy of the World Health Organization (WHO) to attain health for all status by the year 2000. Vaccinology is undergoing a dimensional change with the advances that have taken place in immunology and genetic engineering. Vaccines that confer short or inadequate immunity or that have side effects are being replaced by better vaccines. New vaccines are being developed for a variety of maladies. Monoclonal antibodies and T cell clones have been employed to delineate the immunodeterminants on microbes, an approach elegantly complemented by computer graphics and molecular imaging techniques. Possibilities have opened for obtaining hitherto scarce antigens of parasites by the DNA recombinant route. Better appreciation of the idiotypic network has aroused research on anti idiotypic vaccines. Solid phase synthesis of peptides is leading to an array of synthetic vaccines, an approach that is expected to attain its full potential once the sequences activating suppressor cells are discovered and the rules for presentation of antigens to T and B cells are better worked out. A new breed of vaccines is on the horizon that seeks to control fertility.
