Monoclonal Antibodies And Breast Cancer:

Monoclonal Antibodies and Breast Cancer R. Ceriani, 1985-07-31 Breast cancer being a disease with very high prevalence in the female population has permanently attracted the attention of biologists biochemists pathologists surgeons and oncologists In the U S alone approximately 120 000 new cases are diagnosed and 37 000 deaths a year are recorded as an outcome Early diagnosis clear cut prognosis and the hope of new therapeutic approaches has spurred the enthusiasm of researchers who with the advent of newer methodologies tried to employ it in different approaches to the breast cancer patient In spite of the efforts devoted towards the creation of new approaches reagents and procedures taking advantage of special characteristics of the breast tissue were slow to come In general most diagnostic and prognostic techniques were those shared and applied to other carcinomas In the early seventies we discovered the first sets of antigens associated with breast epithelial tissue both in the mouse and the human The recognition of such group of molecules present in the milk fat globule membrane gave impetus to several studies in these areas These mammary cell surface antigens proved useful in several diagnostic approaches such as radioimaging histochemical and serum assay procedures However the apparently inherent limitations of polyclonal antibodies reduced the impact of these novel approaches *Monoclonal Antibodies and Breast Cancer Detection* Mildred Claudette Chaffin, 1995

Roberto L. Ceriani, 2012-12-06 Today advances in the area of immunology and breast cancer are made at an increasing rate yielding an amount of information that can become unwieldy The opportunity for scientists in this area of research to gather together to exchange results and working hypotheses represents in my belief a very attractive proposition With this in mind these workshops have been convened with two year intervals for the last ten years In each of them selected topics have been highlighted The present workshop underscores the large advancements made in the molecular biology of both breast cancer associated antigens and their corresponding antibodies Understanding the genetic information for the expression of these antigens has been recently advanced leading to preparation of molecularly engineered reagents for use in vaccination serum assays and immunizations for novel antibody production In the anti breast cancer antibody field the availability of molecular engineering approaches to humanize murine antibodies has induced intense interest in the creation of less immunogenic antibody forms that are now available for clinical testing Clinical studies using anti breast murine antibody continue to be carried out and are presented at this meeting establishing a base line for safety and efficaciousness in imaging and immunotherapy that it is hoped will be superseded by the humanized forms Basic immunology and immunochemistry studies in breast cancer are also included in this workshop that demonstrate the fast pace at which this research is advancing in many laboratories worldwide **Immunological Approaches to the Diagnosis and Therapy of Breast Cancer** G.P.

diagnose and possibly treat breast cancer with the new reagents provided by monoclonal antibody techniques In the last two years since our first International Workshop on Monoclonal Antibodies and Breast Cancer there has been an enormous surge in the number and quality of applications for these new reagents Solid achievements have been made in identification and quantitation of estrogen and progesterone receptors in histopathological diagnostic procedures in serum diagnosis and we are witnessing now the first attempts to treat breast cancer with immunoconjugates Cytosolic estrogen receptors can now be quantitated with monoclonal antibodies and also their cellular distribution can be directly assessed histologically In addition monoclonal antibodies to progesterone receptors have been generated that show promise in having similar uses as those to the estrogen receptor In the field of diagnosis the use of monoclonal antibodies has permitted the development of serological approaches for early diagnosis by identifying and measuring breast epithelial antigens in serum and of histological approaches for establishing criteria for breast cancer dissemination and prognosis With great expectations we are all following developments in the area of breast cancer treatment using conjugates of anti breast epithelial monoclonal antibodies which are now confirming earlier reports in affecting breast tumor control The recent creation of newer monoclonal antibodies and conjugates await experimentation and clinical trials to determine their value **Immunological**

means to diagnose and possibly treat breast cancer several milestones have been reached Among them a clear understanding of immunopathological use and limitations of monoclonal antibodies against breast epithelium the complete development and clinical use of immunoassays for circulating breast epithelial antigens the striking advances in the diagnostic use of monoclonal antibodies to estrogen and progesterone receptor proteins and the first communications on proposed immunotherapeutic use of different conjugates of anti breast antibodies New areas of investigation have developed in our field some which are reaching a full blossom while others are still facing obstacles and at times a re definition of their goals and objectives These meetings have acted in a way as a clearing house and have permitted their attendees to derive predictions that have helped shape future research and fine tune objectives But above all the re evaluation of past research at these Workshops and the renewed excitement brought to them by new information has helped generate a momentum and enthusiasm that assures for the future large scientific gains
