Kreuser, Peter M. Schlag, 2012-12-06 This volume focuses on new and exciting approaches in the molecular and clinical management of gastrointestinal tumors The first part presents recent insights into carcinogenesis including alterations in cyclins and adhesion receptors molecular structures which might be new targets of gene therapy The second part of the volume offers new diagnostic tools such as receptors for gastrointestinal hormones proliferation markers tumor suppressor proteins and the multiple drug resistance gene predicting response to therapy and prognosis in gastrointestinal tumors The third part gives an update of successful approaches in primary and secondary prevention of colorectal carcinoma Nutritional factors and pharmacologic agents can clearly decrease the risk and fecal occult blood tests and endoscopy can reduce the mortality in colorectal carcinoma Laparoscopic staging with subsequent biopsy of suspicious lymph nodes provides essential information in esophageal and gastric cancer In locally advanced gastric cancer preoperative chemotherapy provides sufficient evidence to investigate this approach as compared to primary surgery Standards have recently been established in the adjuvant treatment of patients with gastrointestinal carcinoma and promising new drugs including monoclonal antibodies thymidylate synthase and topoisomerase inhibitors as well as taxoids are currently being tested in phase I II and III trials of gastrointestinal tumors **Breast Cancer Detection** United States. Byers, R.

W. Baldwin, 2012-12-06 Over the past 5 years clinical immunology as a whole has advanced more rapidly than over the past 20 years. Many of these advances have been due to monoclonal antibody technology with its ability to identify antigens on tumour cells with a precision never before available. Monoclonal antibodies have the ability to identify subsets of human T lymphocytes and aid in diagnosis of both immunodeficiency disorders such as AIDS or autoimmune diseases and they can be adapted as drug targeting agents. Additionally, however, major advances have been made in identifying immunomodulating agents and the last year has seen two such agents, IL 2 and OKT3, made available commercially for such intervention. Furthermore, another immunomodulating technique, bone marrow transplantation, has now been established as a curative modality in leukaemia treatment. A central issue in tumour immunology is whether human tumours express antigens which can be termed tumour specific. This has important implications for both tumour immunity as well as drug targeting. This issue is considered in detail by R. A. Robins in the introductory chapter in which the expression of antigens in human tumours is compared with that in experimentally induced animal tumours. This controversial issue is also considered in later chapters by Bast in breast carcinoma, Riimke and de Vries in melanoma, V. M. K. in lung cancer, Armitage in colorectal cancer and Paulie and Perlmann in bladder carcinoma.

Attempts to Understand Metastasis Formation III Ursula Günthert, Peter M. Schlag, Walter Birchmeier, 2012-12-06 In metastasis, tumor cells disseminate from the primary lesion and home to secondary organs where they may remain dormant for a long time. Metastasis formation is still the most feared manifestation for tumor patients and clinicians. Although improvements have been made concerning earlier detection and specific therapy, most of the cancer patients still die of distant metastases. The purpose of these three volumes is to review the recent progress in molecular metastasis research and to attempt to further understand the biology of this multifocal process. With respect to present-day molecular biology, the pioneers of metastasis research established the basic concepts of metastasis formation in the 1970s and 1980s, namely clonal selection of metastatic cells, heterogeneity of metastatic subpopulations, organ specificity of metastasis and the importance of angiogenesis. Fidler, Kripke, Nicolson, Folkman and others. In the 1980s and 1990s, several of the molecules involved were identified and their network interactions elucidated. These three volumes of *Current Topics in Microbiology and Immunology* compile the most recent developments on these metastasis-related molecules, their interactions, regulation and ways to interfere with their action. It became evident that metastasis-related molecules are confined to distinct cellular compartments such as the extracellular space, the cell membrane, the cytoplasmic signalling network and the nuclear regulatory system. For the complex metastatic cascade, proteolysis and alterations in adhesive functions are the most obvious and thus one of the most thoroughly investigated processes.
