Rugstad,2013-11-11 This book incorporates the latest advances in immunopharmacological treatment One objective has been to provide appropriate bridges between the basic sciences of immunology and pharmacology on the one hand and clinical medicine on the other A further intention has been to emphasize those advances in immunology and pharmacology that are of clinical importance while retaining those facts that while not new remain clinically useful The immunology section

provides the necessary background for immunopharmacological treatment. The chapters on individual cell types include normal surface markers, mode of activation and activation markers and functions in health and disease. The chapters on pharmacology give comprehensive information on immunosuppressive drugs in regular use today, their biochemical and cellular mechanisms of action, pharmacokinetics, dosage regimens, therapeutic responses, adverse reactions and drug interactions and tolerance. In addition, certain therapeutic principles that are still in an experimental phase are described, for example immunotoxins, thymic hormones and interleukins. The book presents comprehensive information on various autoimmune diseases, the etiopathogenetic immune mechanisms where these are known and the current possibilities for immunopharmacological intervention. The specific disease section also covers rare situations, fluctuations in disease patterns and subgroups of patients and immunopharmacological treatment in these situations. Altogether, the book represents a practical textbook for clinicians and advanced students who want to be updated on therapeutic principles with regard to autoimmune diseases and transplantation.

The Pharmacology of Monoclonal Antibodies Martin Rosenberg, Gordon P. Moore, 2012-12-06 It has been almost 20 years since the discovery by Kohler and

Milstein of the technology to produce monoclonal antibodies MAbs a discovery that promised revolutionary changes in research clinical diagnosis and human therapy From today's perspective it is fair to conclude that this promise has been realized in two areas of the three As research tools MAbs have been invaluable their ability to selectively bind and localize specific antigens detect and identify new ligands and their receptors and agonize and or antagonize specific molecular interactions continues to provide a useful and enabling technology to basic research endeavors Similarly MAbs have demonstrated enormous practical impact as diagnostic tools Recent advances in clinical diagnostic medicine continue to rely heavily on the use of MAb based reagents for detecting and localizing antigens of clinical import In contrast however MAbs have not proven to have major impact on human disease therapy With the single exception of an immunosuppressive MAb against the T cell antigen CD3 MAbs have as yet found few meaningful applications as therapeutic agents During the 1980s a set of technologies to clone modify and express genes encoding MAbs was developed These breakthroughs permitted MAbs to be genetically engineered which consequently gave them the potential to greatly enhance their therapeutic utility as well as significantly expand their research and diagnostic applications New MAbs fragments of MAbs bispecific MAbs single chain MAbs and fusions of MAbs with other gene products became available for study
