Monopulse Radar Theory , 2018-05

There are different types of radars such as search radars tracking radars etc Each of these radars has an explicit application The main task of search radars is to detect targets at long distances and track radars main task is to follow and track the target The main components of the radar range search radars and precision tracking radars and tracking of important issues The monopulse radar system is mainly used for target angle measurement and tracking The information on the target angular position is determined by comparison of signals received in two or more simultaneous beams In recent years combining the monopulse technology and the wideband imaging technology has become a general trend The wideband monopulse radars can synthesize one dimensional high resolution range profiles and two dimensional monopulse angle

measurements to obtain three dimensional imaging of the target Monopulse radars are widely used in target tracking systems because of their superior angular accuracy and powerful antijamming performance The main advantage of a monopulse system in comparison to standard angle measurement methods is that it is not affected by amplitude fluctuations of the target echo because the angle information is acquired by comparing signals received by several simultaneous beams and produced by a single echo pulse If the echo amplitude changes it changes in the same way in all receiver channels Monopulse Radar Theory offers engineers cutting edge treatment of monopulse radar principles techniques and applications The chapters are contributed by renowned authors and researchers dealing with the field Including research reviews and real world examples and cases this practical information guide describes the various forms of monopulse radar and analyzes their capabilities and limitations The book also intended to considerable space to monopulse circuits and hardware elements clearing their functions and performance This book will be a guiding tool for students academic researchers as well as for both experienced radar engineers and those who wish to expand their knowledge in this subject

Inverse Methods in Electromagnetic Imaging Wolfgang-M. Boerner,Hans Brand,Leonard A. Cram,Dag T. Gjessing,Arthur K. Jordan,Wolfgang Keydel,Günther Schwierz,Martin Vogel,2013-11-21 In recent years there has been an increased interest in the use of polarization effects for radar and electromagnetic imaging problems References 1 2 and 3 The problem of electro magnetic imaging can be divided into the following areas 1 Propagation of the Stokes vector from the transmitter to the target region through various atmospheric conditions rain dust fog clouds turbulence etc 2 Scattering of the Stokes vector from the object 3 Scattering of the Stokes vector from the rough surface terrain and the volume scattering 4 Propagation of the Stokes vector from the target region to the receiver 5 The characteristics of the

receiver relating the Stokes vector to the output The propagation characteristics of the Stokes vector through various media can be described by the equation of transfer Even though the scalar equation of transfer has been studied extensively in the past the vector equation of transfer has not received as much attention In recent years however a need for further study of the vector radiative transfer theory has become increasingly evident and several important studies have been reported This paper presents a general formulation of the vector theory of radiative transfer under general anisotropic scattering conditions Some useful solutions are also presented 4 8 for several practical situations 2 GENERAL FORMULATION OF VECTOR RADIATIVE TRANSFER THEORY Let us consider the plane parallel problem Shown in Figure 1
