Monterey Formation Associated Coarse:

Monterey Formation and Associated Coarse Clastic Rocks, Central San Joaquin Basin, California L. A. Williams, Stephan Alan Graham, 1982 **Siliceous, Phosphatic and Clauconitic Sediments of the Tertiary and Mesozoic** Akihito Iijima, A. M. Abed, 1994-04 This Proceedings volume contains 14 papers from the symposium Siliceous Phosphatic and Glauconitic Sediments of the Tertiary and Mesozoic which was held during the 29th International Geological Congress Kyoto Japan 24 August 3 September 1992 The first part of this volume consists of papers dealing with Tertiary biosiliceous sediments of the Pacific Rim starting in the northwest The second part of the volume is composed of papers dealing with Tertiary and Mesozoic phosphatic rocks and phosphatebearing sequences in particular of the eastern Pacific Rim and the Middle East The articles serve to emphasize the similarities and differences between the Pacific Neogene successions and the Tethyan Mesozoic sequences of the Middle East Classic Cordilleran Concepts Eldridge M. Moores, Doris Sloan, Dorothy L. Stout, 1999-01-01 Microtextural, Elastic and Transport Properties of Source Rocks Ramil Surhay Oglu Ahmadov, 2011 This dissertation addresses recurrent questions in hydrocarbon reservoir characterization In particular the major focus of this research volume is microtextural characterization of source rock fabric as well as elastic and transport properties of source rocks Source rocks are one of the most complicated and intriguing natural materials on earth Their multiphase composition is continually evolving over various scales of length and time creating the most heterogeneous class of rocks in existence The heterogeneities are present from the submicroscopic scale to the macroscopic scale and all contribute to a pronounced anisotropy and large variety of shale macroscopic behavior Moreover the effects of the multiphase composition are amplified within organic rich rocks that contain varying amounts of kerogen Despite significant research into the properties of kerogen fundamental questions remain regarding how the intrinsic rock physics properties of the organic fraction affect the macroscopic properties of host rocks Because we do not fully understand the elastic properties of either the organic matter or the individual clay minerals present in source rocks seismic velocity prediction in organic rich shales remains challenging Conventional measurements of macroscopic or average properties on core plugs are not sufficient to fully address the degree of property variation within organic rich rocks Alternatively most analyses of organic matter rely on samples that have been isolated by dissolving the rock matrix The properties of the organic matter before and after such isolation may be different and all information about sample orientation is lost In addition comprehensive characterization of organic rich rocks has been hindered by several factors sample preparation is time consuming and the nanogranular nature of this rock type makes it difficult to link effective elastic properties to maceral properties such as elastic moduli composition maturity and quality These difficulties have prevented us from building large databases without which we cannot establish the accurate rock physics models needed for inverting field geophysical data I approach this issue using atomic force microscopy based nanoindentation coupled with scanning electron and confocal laser

scanning microscopy as a tool for visualization and identification of the organic part within shale and to perform nanoscale elastic property measurements First the microfabric of a set of source rock samples is characterized The spatial and temporal link between organic matter and the stiff silicate mineral matrix is established which leads to proposal of alternative Rock Physics modeling approach to organic rich source rocks Based on the nanoindentation measurements I obtain elastic properties of source rock phases and provide several applications of these nanoindentation derived elastic properties within a number of geomechanical problems Finally transport properties of various source rock formations are discussed based on comparison to more conventional reservoir rocks

Approximately 3000 middle and late Cenozoic nearshore marine molluscan taxa from western California are assigned to six time periods spanning 25 m y In this interdisciplinary study western California is palinspastically restored for each of the time periods by backsliding and back rotating large fault blocks or crustal units Marine fossil assemblages are assigned to nearshore paleoclimatic regions or water masses within palinspastically restored California In addition this volume reveals positive feedback mechanisms between paleolatitudinal changes in sea surface paleotemperature gradients and changes in the diversity of marine mollusks along the California coast through time defines equable based effective temperatures and analyzes extinction rates among macroinvertebrate marine taxa from coastal California and the possible causes of these extinctions The late Paleogene to Neogene faunas reflect an increase in faunal diversity related to strengthened temperature gradients greater extremes in sea surface temperatures reduction in temperateness and the development of an embayed California coastline
