Reduced Instruction Set Computer Architectures for VLSI M. G. H. Katevenis, 1983 The architectural study and evaluation of RISC II as well as its design layout and testing after fabrication have shown the viability and the advantages of the RISC approach The RISC II single chip processor looks different from other popular commercial processors it has been less total transistors it spends only 10% of the chip area for control rather than one half to two thirds and it required about five times less design and lay out effort to get chips that work correctly and at speed on first silicon And on top of all that RISC II executes integer high level language programs significantly faster than these other processors made in similar technologies

TRON Project 1987 Open-Architecture Computer Systems
Ken Sakamura, 2012-12-06 Almost 4 years have elapsed since Dr Ken Sakamura of The University of Tokyo first proposed the TRON the realtime operating system nucleus concept and 18 months since the foundation of the TRON Association on 16 June 1986 Members of the Association from Japan and overseas currently exceed 80 corporations The TRON concept as advocated by Dr Ken Sakamura is concerned with the problem of interaction between man and the computer the man machine inter face which had not previously been given a great deal of attention Dr Sakamura has gone back to basics to create a new and complete cultural environment relative to computers and envisage a role for computers which will truly benefit mankind This concept has indeed caused a stir in the computer field The scope of the research work involved was initially regarded as being so extensive and diverse that the completion of activities was scheduled for the 1990s However I am happy to note that the enthusiasm expressed by individuals and organizations both within and outside Japan has permitted acceleration of the research and development activities It is to be hoped that the presentations of the

Third TRON Project Symposium will further the progress toward the creation of a computer environment that will be compatible with the aspirations of mankind

Computer Architecture Michael J. Flynn, 1995 Computer Architecture Software Engineering Numerical Algorithms for Modern Parallel Computer Architectures Martin Schultz, 2012-12-06

Parallel computers have started to completely revolutionize scientific computation Articles in this volume represent applied mathematics computer science and application aspects of parallel scientific computing Major advances are discussed dealing with multiprocessor architectures parallel algorithm development and analysis parallel systems and programming languages The optimization of the application of massively parallel architectures to real world problems will provide the impetus for the development of entirely new approaches to these technical situations Architecture of Computing Systems - ARCS 2019 Martin Schoeberl, Christian Hochberger, Sascha Uhrig, Jürgen Brehm, Thilo Pionteck, 2019-05-13 This book constitutes the proceedings of the 32nd International Conference on Architecture of Computing Systems ARCS 2019 held in Copenhagen Denmark in May 2019 The 24 full papers presented in this volume were carefully reviewed and selected from 40 submissions ARCS has always been a conference attracting leading edge research outcomes in Computer Architecture and Operating Systems including a wide spectrum of topics ranging from embedded and real time systems all the way to large scale and parallel systems The selected papers are organized in the following topical sections Dependable systems real time systems special applications architecture memory hierarchy FPGA energy awareness NoC SoC The chapter MEMPower Data Aware GPU Memory Power Model is open access under a CC BY 4.0 license at link.springer.com The Sun Technology Papers Mark Hall, John Barry, 2013-12-14 The Technology of Sun Microsystems Two years ago Sun Microsystems began publishing a quarterly technical journal Sun Technology The Journal for Sun Users Since then its pages have explored in detail diverse technology and products relating to Sun The journal's technically sophisticated readers are likely to apply the information published in the journal to their work Sun Technology has been written by technologists for technologists In the pages of The Sun Technology Papers you will find an extensive selection of those articles No other single volume offers you such a broad view of Sun related technology and products Yet this sweeping embrace of subjects does not diminish the level of detail in this collection Short of Sun's 40 pounds or so of documentation no other single source provides as deep and broad an understanding of Sun technology as this book does Because Sun is a key developer in so many areas of computer technology the book comprises four general sections The first Software includes chapters on Open Network Computing Sun's compilers SunOS and SPARC and the Network Software Environment The Hardware section covers SPARC in great detail and includes the most in depth examination of the popular SPARCstation 1 This section also contains chapters on the Sun386i workstation Embedded Processor Design Challenges Ed F. Deprettere, Stamatis Vassiliadis, 2003-07-31 This textbook is intended to give an introduction to and an overview of state of the art techniques in the design of complex embedded systems The book title is SAMOS for two major reasons First it tries to focus on the actual distinct yet important problems of System Level

design of embedded systems including mapping techniques and synthesis Architectural design Modeling issues such as specification languages formal models and nallySimulation The second reason is that the volume includes a number of papers presented at a workshop with the same name on the Island of Samos Greece in July 2001 In order to receive international attention a number of reputed researchers were invited to this workshop to present their current work Participation was by invitation only For the volume presented here a number of additional papers were selected based on a call for papers All contributions were refereed This volume presents a selection of 18 of the refereed papers including 2 invited papers The textbook is organized according to four topics The first is A System Level Design and Simulation In this section we present a collection of papers that give an overview of the challenging goal to design and explore alternatives of embedded system implementations at the system level One paper gives an overview of models and tools used in system level design The other papers present new models to describe applications provide models for refinement and design space exploration and for tradeoff analysis between cost and executability of an implementation

The Second Age of Computer Science

Subrata Dasgupta, 2018-05-01 By the end of the 1960s a new discipline named computer science had come into being A new scientific paradigm the computational paradigm was in place suggesting that computer science had reached a certain level of maturity Yet as a science it was still precociously young New forces some technological some socio economic some cognitive impinged upon it the outcome of which was that new kinds of computational problems arose over the next two decades Indeed by the beginning of the 1990s the structure of the computational paradigm looked markedly different in many important respects from how it was at the end of the 1960s Author Subrata Dasgupta named the two decades from 1970 to 1990 as the second age of computer science to distinguish it from the preceding genesis of the science and the age of the Internet World Wide Web that followed This book describes the evolution of computer science in this second age in the form of seven overlapping intermingling parallel histories that unfold concurrently in the course of the two decades Certain themes characteristic of this second age thread through this narrative the desire for a genuine science of computing the realization that computing is as much a human experience as it is a technological one the search for a unified theory of intelligence spanning machines and mind the desire to liberate the computational mind from the shackles of sequentiality and most ambitiously a quest to subvert the very core of the computational paradigm itself We see how the computer scientists of the second age address these desires and challenges in what manner they succeed or fail and how along the way the shape of computational paradigm was altered And to complete this history the author asks and seeks to answer the question of how computer science shows evidence of progress over the course of its second age

Arms and Artificial Intelligence

Stockholm International Peace Research Institute, 1987 The impact of information technology in the field of military decision making is superficially less visible than that of a number of other weapon developments though its importance has grown steadily since the beginning of the 1980s Owing to its potential role in modern weapon systems and the prospect of its inclusion as an

essential ingredient in many military projects such as the Strategic Defence Initiative it has become the focus of special interest and efforts This book is the first attempt to present a broad overview of the prospects for information technology in general and machine intelligence in particular in the context of international security The dangers and promises of weapon and arms control applications of computers and artificial intelligence to decision making processes are analysed in a technical strategic and political perspective by experts from six different countries In an introductory chapter Allan Din presents a generic overview of artificial intelligence and its prospects Thirteen contributors then discuss the conceptual and technical framework of artificial intelligence analyse implications for weapon systems and strategy and discuss possible applications to arms control verification and modelling

Computing Perspectives Maurice V. Wilkes, 2014-06-28 In this insightful collection of essays Maurice Wilkes shares his unique perspective on the development of computers and the current state of the art These enlightening essays discuss the foundational ideas behind modern computing and provide a solid grounding for the appreciation of emerging computer technologies Wilkes one of the founders of computing has provided enormous contributions to the development of computers including the design and construction of the EDSAC computer and early development of programming for a stored program computer He was responsible for the concept of microprogramming Wilkes also wrote the first paper to appear on cache memories and was an early worker in the field of wide bandwidth local area networks In 1992 he was awarded the prestigious Kyoto Prize for Advanced Technology These essays will be of interest to everyone involved with computers and how they arrived at their present state Wilkes presents his perspectives with keen historical sensibility and engineering practicality Readers are invited to consider these observations and form their own perspectives on the present state of the computer art

Third Caltech Conference on Very Large Scale Integration R. Bryant, 2012-12-06 The papers in this book were presented at the Third Caltech Conference on Very Large Scale Integration held March 21-23 1983 in Pasadena

California The conference was organized by the Computer Science Department California Institute of Technology and was partly supported by the Caltech Silicon Structures Project This conference focused on the role of systematic methodologies theoretical models and algorithms in all phases of the design verification and testing of very large scale integrated circuits The need for such disciplines has arisen as a result of the rapid progress of integrated circuit technology over the past 10 years This progress has been driven largely by the fabrication technology providing the capability to manufacture very complex electronic systems reliably and at low cost At this point the capability to manufacture very large scale integrated circuits has exceeded our capability to develop new product designs quickly reliably and at a reasonable cost As a result new designs are undertaken only if the production volume will be large enough to amortize high design costs products first appear on the market well past their announced delivery date and reference manuals must be amended to document design flaws Recent research in universities and in private industry has created an emerging science of very large scale integration

Taiwan's Semiconductor Miracle Tain-Jy Chen, Chin-Tay Shih, 2025-11-18 This book examines how a series of inconceivable developments in the semiconductor industry over the last 40 years shaped modern Taiwan Covering one of the most dramatic episodes in modern technology history this book outlines the ascent of a resource impoverished and technology disadvantaged country to a leading position in the world's most complex industry which requires immense resources and technologies to succeed The book focuses on three major factors that contributed to this success the adoption of the foundry model the formation of human resources and the role of the state The role of geopolitics in Taiwan's success is also assessed including how the US Japan Trade Arrangement has contributed to the decline of Japan's semiconductor industry the emergence of Chinese competitors and the resulting containment policies of the likes of Japan the US and Europe in favor of domestic production in recent years Illustrating the importance of strategy and human dedication and the roles of the state and international politics this book will be a valuable resource to students and scholars of Taiwanese politics history and business
